Edward I. fummoned Baliol to meet him here I2g6; aid on his refufal inquded Senthand, and took him prifoner. Edward 11. heltered Gavelton here 1310. It was theen by the Yorkills after the batte of Hexham. In the reign of Elizabeth Sir John Forlter, warden of the marches, was governor of it, and madc a knight banneret after the battle of Miufelburgh; and his grandfon John obtained a grant of both catle and manor from James I. His defcendant 'lhomas furfeited it in 1715 ; but his maternal uncle Nathaniel Crew buthop of Durham purchafed and bequeathed them to unconined charitable ufes. The ruins are thill conliderable; but many of them now filled with fand, caught up by the winds whicla rage here with great vioknce, and carried to very ditant places. The remains of a great hall are very fingular; it had been warmed by two lire places of a vall frze, and from the top of cvery window ran a fue like that of a chimney, which reached the fummits of the battements. Thefe flucs feem defigred as fo many fupernumerayy chimnics to give vent to the Imoke that the immenfe fires of thofe hofpitable times billed the rooms with; for halls fmoky, but filled with good cheer, were in thofe days thought no incorvenience. In the year ${ }^{5757}$, the trultees for lord Crew's charity began the repairs of the keep or geent tower ; the direction and management beans comanited to Dr Sharp archdeacon of Durham, one of their number; who has made a moll judicious and humane application of his lordhip's generous bequet. The walls are from 9 to 52 feet thick. The upper parts of the buildar have been formed into granaries; whence, in times of Carcity, corn is fold to the indigent without any diftinction at four fhilloggs per buhel. A hall and fome fmall apartments are referved by the Doekor, who freguently refides here to fee that his noble plan is properly execuied. - Among the variety of dittreffel who find relief from the judicious difpofition of thes charity, are the matiners navigating this dangerous coath, for whole benefit a conflant watch is kept on the top of the tower; from wheroce fignals ate given to the filhermen of Holy Inand when any hip is difcovered in diatefs, thefe fithermen by their fituation bsing able to put of their boats when none from the land can get over the breakers. The fignals are fo regulated as on point out the particular place where the diftreffed veffel lies. Belides which, iin crery grattiorm, two men on horkback patrole the adjacent coall from fun fet to fun-rife, who, in cate of any thipareck, are :o give inmediare notice at the calle. Promiuns are likewife paid for the earliett information of any fuch misiortune. By there means the lives of many feamen have been, and will be, preferved, who would otherwhe have perithed for wan of timely affitance. Nor does this benevolent ariangement top here. The Miparecked mariner finds an hofpitable reception in this cafle; and is here maintained for a weck or Innger, as cucumblances may requre. Here, likewife, are itore-houfes for depuliting the goods which may be laved; iultruants and taskle tor weighing and raifing the funken and Aranded veffis; and, to complete the whote, at the expence of thes fand, the but offices are decently performed to the bodies of fuch drowned failors as are catt ou thure.

HOME (Heary), Lood Fanes, an eminent Scot. tifa lawyer, atd author of many calebrated works on various lubjucts, was defeended of a'very honomable and ancient family, and born in the ycar $160 t 2$. Lord Kames's crandfather, Hensy H me, was a younger fon of Sir John Enome uf Renton, who held the high offre of lord juticecterk, or chade ami nal judge of Scniland, in the year 1663 . He received the dlate of ixames from his mele George, brother to the then iord jutico-clerk. The family of Renton is defcence: from that of the earls of llome, the reprefentatives of the ancient primes of Nuthmm. berland, as wpears frem the records of the Lion Office.

The county of Derwick in Scotland has the honour of having given birth to this great and nfeful momber of fociety. In early youth he was lively, and eager in the accamion of knowledge He never atteraled a purive litom; but "as intructed in the ancient and yodern hamages, as well as in feveral branches of mathematies, and the arts necefarly consected with that fcicnce, by Mr Wingate, a man of
confifterable parts and learniag. whon font many yers as raeceptor or patiate tutor to Mr 11 mine.

Atter fudyines, with acntenefsand dilipence, at the univerlity of Elimburgh, the civil law and the municipd haw of his own country, Dir Home early perceivel that a knowledre of thefe alone is not fufficient 20 make an accomplifhed lawyer. An acquaintance wita the finms and practical bulinefs of courts, and efpecially of the fupreme court, as a nsember of which he was to feek for fame and emolument, he conlidered as effentially necellary to qualify him to he a complete barriller. He accordingly attended for fome time the chamber of a writer to the fignct, where he had an opportmity of leaning the ftyles of legal deeds, and the mokles of comdufting different fpecies of bulinefs. This wife tlep, independently of his great gemius and unwearied application, procured him, after his admifion to the bar, peculiar iefpect from the court, and proportional employment in his profeffion of an advocate. Whoever perufes the law-papers compoled by Mir Home when a young man, will perceive an uncommon elegance of llyle, befides great ingenuity of reafoning, and a thorough knowledge of the law and contitution of his country. Thefe qualifations, toget her with the llrength and vivacity of his natural abilities, fuon raifed him to be an ornament to the Scottim bar; and, on the 2 d day of Fibruay 1752 , te was advanced to the bench as one of the judges of the court of fimbon, under the title of Lord Kiames.

Before this period, lowever, notwithfanding the unavoidable labours of his profemon, Mr Home had favoured the world with feveral ufeful and ingenious works. In the venr 172S, he publifhed Remarkable Deciftons of the Court of Se, Ton fron 1-176to 1728, in one vol folin.- 111 1-32 appeared Efluy upen feveral fub-
 nam; Jono Thechtem; and Preforiprote: in one volume Svo. This firt produce of his orictmal cemius, and of his extentive pins, excited not onfy the attention, but the admeration of the judges, and of all the other members of the collegre of juttice. This wonk was fucceeden, in the year 1741, by Decifions of the Court of Sel/bon fiom its fiog inftrutions to the vear 1740, abridged amd digefled unier popr heculs, in form of a Ditionary, in two volumes folio: A very liburisis work, and of the gratell utility to every practical lawyer. In 1747 appeared Efitys afon feveral fubjells conterning Driti/h Antiquates, vie. 1. Iutrocuction of the feudal law into Suntand. 2. Contitution of parliament. 3. Honour, Jignity. 4. Sucedion, or Defent; with an appendix upon heredien and indefeafible righ, compard anno 1-45. and publinied if7, in one volume Swo In a preface to this work, l,urd liames informs us, that in the year- $17+5$ and 1746 , when twe nation was ingreat fuppente and dithraction, be retied to the country; and in order to banith as much as poffible the meabuefs of his mind, he connived the plan, and cxecuted this ingenious performance.

Though not in the nder of time, we Mall continue the litt of all our autho's writings on law, before we proceed to his produrions on other fubjects. In 1.59, he mablifhed Tike Stame luru of Sarland alridged, witb billorival notes, in one volume 8wo: a mot nfeful and laborions wots. In the year $: 759$, he preferted to the public a new work under the title of Hillo-

## $\mathrm{H} \quad \mathrm{O} \quad \mathrm{M}$

c. rical Lacu Trafls, in one vol. 8vo. It contains fourteen interefling tracts, viz. Hiflory of the Criminal Law :Hittory "of l'romifes and Cuvenams: - Hiflary of Pro-perts:- Hittory of Sccuritics upun and for Payment of Debt :-.-Hiftory of the Privilege whichas HEir-apparent in a feudal holding has to continue the Pufferion of his Ancefor :- Hithory of Regalities, and of the Privilege of repledging :- Hiftory of Courts:- Hilory of Bricues:- Hintory of Prencefs in abfence:- Hutury of Execution againd Moveables and I.and for Payment of Debt:- Hittory of Perfonal Execution for Payment of Deht: - Hiltory of Execution for obtaining Payment after the Death of the Dibtor: - Iiflory of the limited and univerfal Reprefeataion of Heirs:-Oid and New Extent. In 1-10, he publihed, in nne volume folio, The principles of ERTuity; a work which Thows buth the fertility of the author's genius and his imbefatigable application. In $: 7$, 6 , he gave to the public another vilume in folio of Renarticulle Decifions of the Court of Sc/fon, from 1730 to $1752 . \ln 1777$, appared nis Elisildations rejpeding the Lummon ant S'tathe Sorw of Scolland, in une volume 8 ro. 'this buok contains many curious and interelling remarks upon fome intricate and dubious points which oceur in the law of Scotland. In 1:80, ine publithed a volume in folio of Selea Decifions of the Caurt uj Sejun from 1752 10 1768.

From this Netch of Lord Kames's compolitions and collections with a view to improve and eluchdate the laws of Scotland, the ieader may form fome idea of his great indutlry, and of his anxious celine io promote the honour and welfare of his conntry. It remains to be remarked, that in tie fupreme cunt there, the law writings of Lord Kames ane held in equal ellimation, and quoted with equal refpect, as thofe of Coke or Blackflune in the courts of Eugland.

Lord Kames's mind was vory much inclined to metaphyfical difquifitions. When a young man, in order to improve himfelf in his favomite flady, he correfponded with the famous Berkeley bithop of Cluyne, 1) Bualer bithop of lemrhar, I) Samuel Clark, and many other ingenious and learned men buth in Britain and Ireland. The letters of correfpondence, we are happy to learn, have been carefully preferved by his fon and heir George Home-Drummond, Efq; of Blair-Drummond.

The year 175: gave birth to the firlt fruits of his Lordfhips metaphyfical Itudies, under the title of Eflids on the I'rinciples of Morality and natural Refjion, in wo parts. Though a fmall wolume, it was replete with ingentity and acute reafoning, excited general attention, and gave rile to much contruverify. It comained, in more seplicit terens than pertaps any other work of a religions theit then known in Scotland, the doctrine which has of late made fo much noife under the appellation of shilf fositical necoflity. The fame thing had indeed been taught by Fobbes, by Collins, and by the cclebrated David Hume, Efq; but as thofe anthors either were profefled infiels, or were fuppofed to be fuch, it excited, as coming from them, no wonder, and provosed for a time very little indignation. But when a writer, who exhihited no fymptoms of extravagant fecpticifm, who intinuated nothing apainft the truth of revelation in general, and who inculeated with earneltnefs the great dutics of morality and natural religion, advan.
ced at the fame time fommonimon a dnctrine as that of Home. ne eflify; a number of pens were immediately drawn againt him, and for a white the work and its anthor were extremelv obnusions so a great part of the Scot. tifh nation $O$ on the other hand, there were fome, and thofe not totally illiterate, who, comfounding necelaty with pradflination, complimented Mr Home on his ma. Aerly defonce of the ellablimed faith: and though between the fe two feliemes there is nu furt of refemblance, except that the future happincfs or mifery of all men is, according to outh, certainly fore-knowa and appointed by God; yet we remember, that a profelter in a dillenting academy fof far mitook the one for the other, that be recommeuded to his pupils the EfTays on mordiy and mabual religion, as containing a complete vindication of the doctrine of Calvin. For this miffake he was difmiffed from ini, uftiee, and excluded from the commenniun of the feet to which he belonged. Lord Lames, like many other great and geosd men, continued a Neceflarian to the day of his death: but in a fubfequent edition of the effays, he exhabited a remarkable proof of his candor and liberality of fen'inent, by alicring the expreflions, which, contrary to his intention, had given fuch general offence.

In 176 t, be publithed an Introduaizen to the Ant of Thimkiag, in one volume t2mo. This fonall but valuable book was originally intended for the in trisetion of his own family. The plan of it is buth curisus, amufing, and highly calculated to eatch the attention and to improve the minds of youth. It confits of maxims collected from Rochefoncault and many other authors. To illaitrate thele maxims, and to rivet their fpirit and meaning in the minds of young perfons, his Lordhip has added to molt of them beautiful thories, fables, and histurical anceduces.

In the departmont of belles leteres, his Elcments of Crikijn appeared in 1,62 , in three sotumes Svo. This valuable work is the lirll and a malt fuccels. ful attompt to fhow, that the art of criticilm is found. cd on the principles of human nature. Such a plan, it might be thought, thould hase prodoced a dry and phlegenatic performance. Lurd Lames, on the contraty, from the fprighelinefs of his manner of treating every fubject he handled, has rendered the Elements of Criticifar not only highly indrustive, but one of the moft entertaining books in our language. Betore this work was publithed, Rullin's Belles Lettres, a dull performance, from which a fulent could derise little ad. vantare, was univerially recommended as a landard; but, after the Eikments of Criticifo were pretented to the public, Rollin intanily vanihed, and gave place to greater senius and greater uibity. With regard to real intruction and gernine tale in compofition of every kind, a ltudent, a genuleman, or a jchular, can is no language find fuch a fertile lield of information. Lord Kames, accordugly, had the happinefs of fecing the good effects of his labours, and of enjoying fut twenty ycars a reputation which he o jultly merited.

A till farther proof of the genius and various purfuits of this active mind was given in the year 1772, when his Lordhip publifhed a wotk in one volume 8wo, under the titlc of The Genticman Farner, bing an altimat to improze Alyricu'sure by fubjeching it so the eff of radinest peimeifes. Our limits do not permit us to give details: bur, with regatd to this bok, we.
fowe L-...
mut inform the public, that all the imtelligent farmers ind Scothand uniformly deelare, that, after perufing Young, Dickfon, and a hundied other writers on agrieulture, Lord Kames's Genteman Farmer contains the bet fractical end rational information on the vanious atticles of hufandry which can any where be whained. As a practical farmer, Lord Kames has given many obvious proofs of his disill. After he fueceded, in right of his lady, to the anple eflate of Bhir-Drummond ia the eounty of Peth, he formed a plan for torning a large mofs, containg of at leat 1500 acres, into arable lasd. His Lordhip had the phatime, before he dict, to fee the plan fuccofffully, thongh oaly partiatly, exccuted. The fame flan is nuw canying on in a much more rapid manner by his fon George Drummond, Efy. But as this is not a proper place for datals of this nature, we mult refer the teader to the article Moss; where a particular account of this expracdinary, but extenficely uffut, operation thall be given.

In the year $1-53$, Lord Kames favoured the world with Sletches of the Hiffory of Man, in 2 vols $4: 0$. This wuth cuatits of a great variciy of facts and oblervations concerning the nature of nam; the produce of mueh and protitable reading. In the courfe of his fledies and realonings, he bad amafled a valt collection of materials. Thele, when confoderably advaneed in years, he digeted under proper heads, and fubmitted them to the confideration of the public. He intended that :his book flowld be cupally inteligithe to wonen as to retu; and, to accomplth this end, when he had oceafion to quote ancient or foreign books, he aniformly thanlated the paflages. The Sketches contain much urful information; and, like all his Lordthip's other performances, are lively and entertaining.

Wre now come to l.ord Kames's latt work, to which he modefly gives the title of Loofe Ifints aponi Education, chiefy concerning the Culture of the Fieart. It was publithed in the gear $1-8 \mathrm{c}$, in one vol. 8vo, when the vencrable and aftonifhing author was in the 85 th year of his age. Though his Lordthip ehofe to call them Larj: Wints, the intelligent reader will perceive in this compolition an uncommon activity of mind at an age fo fa adranced beyond the ufual period of human life, and an earneft delire to form the minds of youth to honour, to virthe, to induftry, and to a veneration of the Deity.

B dide the books we have erumcated, Lord Kames foblifitd nany un porary and fugitive pieces in diffecont periedical works. In the Eflays flyjical and fitures, blilfaed by a focity of gentemen in EdinLargh, ve fratcompations of his Lordhip On the Lates

 maks of quates and originalty of thinking.

How a man amployed through life in public bufinefs, 2. $15 \%$
and in buffefs of the firlt impurtance, cowid find leifure for fo many different purfuits, and excel in them (a), it is not eafy for a meaner mind to form even a conception. Mueh, no doub:, is to be atrributed to the fuperiority of his genius; but much muft likewife have been the refult of a proper diftribution of his time. He rofe early; when in the vigour of life at four o'clock, in old age at fix: aind hudied all morning. When the coutt was litting, the duties of his office employed him from eight or nine till twelve or one; after which, if the weather permitted, he walked for two hours with fome literary friends, and then went home to dinner. Whillt he was on the beneh, and we belicue when he was at the bar, he neither gave nor accepted invitations to dimer during the term or fofton; and if any friend came uninvited to dine with him, his Lordmip difplayed his ufnal cheerfulnefs and hofpitality, but always retired with his clerk as foon as he had drunk a very few glaffes of wine, leaving his company to be entertained by his lady. The afternoen was fpent as the morning had been, in fudy. In the evening he went to the theatre or the concert, from which he returned to the feciety of fome men of learning, with whom he fat late, and difplayed fueh talents for converfation as are not often found. It is obferved by a late celebrated author, that " to read, write, and converfe, in due proportions, is the bufinefs of a man of letters; and that he who hupes to look back hereafter with fatisfaction upon patt yeare, mat learn to klow the value of lingle ininutes, and endeavour to let no particle of time fall ufelefs to the ground." It was by practiang thefe lefions that Lord Kames rofe to literary eminence, in oppofition to all the obflaces which the tumult of public bufinefs could place in bis way.

To give a proper delineation of the public and private charugter of Lord Kames, would far exeeed our limits. The writer of this artiele, however, who had the honour of an intimate acquaintance with this great and good man for more than twenty years, mutt be indulged in adding a few facto which fell under his own obfervation.
Lord Kames was remarkable for publie fpirit, to which he conjoined activity and grcat exertion. He for a long tract of time had the principal management of all the focicties and boards for promotiog the trade, fiheries, and manufaiuures, in Scotland. As conducive to thofe conds, he was a Atrenuous advocate for making and repaining turnike roads through every part of the country. He had likewife a chief lead in the dittribution and application of the funds arifing from the eftates in Scotland which had unfortunately been annexed to the crown. Hic was no lefs zealous in fupporting, both with his writings and perfonal influence, litcrary aflociations. He sras in forme meafure the parent of what was ealled the Phyfical and Literary Society. This fociciy was afterwards incorpo-
rated
(A) U'pon reflecting on the fludioufnefs of Lord Kames's difpofition, and his numercus literary productions, the raded will naturally recal to his mind a lriking fimilarity between his Lordhip and the laborious Pling the Elder. In a litter fom Pling the Vounger to Macer, the fullowing paffage oceurs, whieh is equally apphicable to both: Nome eidetitr tili, recordianti quantura ligerit, quantums foritferit, nec in oficiis whlis, nec in amisilia frincifun filfe? which is thes thanflated by Melmoth: "When you reftet on the books he has read and the volumes he has witten, are youn not inclined to fufpect, that he uever was engaged in the allairs of the putlic, or the fervice of his pince?".

## 

me. rated into the Royal Society of Edinburgh, which received a charter from the crown, and which is daily producing marks of genius, as well as works of real utility.
As a private and domeftic gentleman, Lord Kames was admired by both fexes. The vivacity of his wit and of his animal firits, even when advanced in years, rendered his company oot only agreeable, but greatly folicited by the literati, and courted by ladies of the higheft rank and accomplihments. He told very few fories; and rarely, if ever, repeated the fame thory to the fame perfon. From the neceffity of retailing anecdotes, the miferable refuge of thofe who, without genius, attempt to thine in converfation, the abundance of his own mind fet him free; for his wit or his learning always fuggetted what the occafion required. He could with equal eafe and readinefs combat the opinions of a metaphyficiat, unravel the intricacies of law, talk with a farmer on improvements in agriculture, or ellimate with a lady the merits of the dreff in fathion. Inftead of being jealous of rivals, the characterillic of little minds, Lord Kames foltered and encouraged every fymptom of merit that he could difcuver in the fcholar, or in the loweft mechanic. Befure he fucceeded to the ellate of Blair-Drummond, his fortune was fmall. Notwithflanding this circumblance, he, in conjunćtion wids Mrs Drummond, his refpeetable and accomplifhed fpoufe, did much mure fervice to the indigent than moft families of greater opulence. If the prefent neceffity was preffing, they gave money. They did more: When they difcovered that male or female petitioners were capable of performing any art or labour, both parties exerted themfelves in procuring that fpecies of work which the poor people could perform. In cafes of this kind, which were sery frequent, the lady tuuk charge of the women and his Lordhhip of the men. From what has been faid concerning the varione and numerous productions of his genius, it is obvious that there could be few idle moments in his long protracted life. His mind was inceffantly employed; either teeming with new ideas, or purfuing active and laborious occupations. At the fane time, with all this intellectual ardour, one great feature in the character of Lord Kames, befide his literary talents and his public \{pirit, was a remarkable innocency of mind. He not only never indulged in detraction, but when any Species of fcandal was exhibited in his c.mpany, he cither remained filent, or endeavoured tu give a different turn to the converfation. As natural confequences of this amiable difpofition, he never meddled with poltics, even when parties ran to indecent lengths in this country; and, what is fill more remarkable, he never wrote a fentence, notwithtanding his numerous publications, without a direct and a manifell intention to benefit his fellow creatures. In his temper he was naturally warm, though kindly and affectionate. In the friendhips he furmed, he was ardent, zealous, and fincere. So far from being inclined to irreligion, as fome ignorant bizuts infinuated, few men poffeffed a more devout habit of thought. A conftant fenfe of Deity, and a veneration for Providence, dwelt upon his mind. From this fuerce arufe that propenfity which appears in all his writings, of inve! igating final caufes, and tracing the wifdom of the Supreme Author of nature. But here we mult llop. Lord Kames, to the Voz. VIII. Part II.
great regret of the public, died on the 27 th day of De. cember 1782 . As he liad no maiked difeale but the debility neceffurily refulting from extreme old age, a few days before his death he went to the Court of Seffion, addreffed all the judges feparately, told then he was fpeedily tu depart, and took a fulemn and an affectionate farewell.

HOMER, the prince of the Greek poets, flourih. ed, according to Dr Blair, about 9 co 6. C. accord. ing to Dr Prieftley 850, according to the Arundelian marbles 300 , after the taking of Troy ; and agreeable to them all, above 400 years before Plato and Aritotk. Seven cities difputed the glory of having given him birth, viz. Snyrna, Rhodes, Colophon, Salamis, Chios, Argos, and Athens; which has been expreffed by the following diftich:

```
Smyran. Rb des, Cotophon, Salumis, Cbios, Argor, Athene:
    Urbis d patris certat, Honere dua.
```

We have nothing that is very certain in relation to the particulars of his life. 'The motk regular account is that which goes under the uane of Herodotus, and is ufually printod with lis hiftory: and thungh $t$ is generally fuppofed to be a fpurious piece, yet as it is atncient, was made ule of by Strabu, and exhibits that idea which the later Greeks, and the Romans in the age of Augullus, entertaned of Humer, we nult content ourfelves with giving an abllract of it.

A man of Magnelia, whofe name wras Menalipfus, went to lettle at Cunax, where he maried the daughter of a citizen called Homyres, and had by her a daughter called Critheis. The father and nother dying, the young woman was left under the tuition of Cleonax her father's friend, and fuffering herfelf to be deluded was got with child. 'I'he guardian, though his care had nut prevented the misfortune, was however wilhing to conceal it; and thetefore fem Critheis to Smyrna, which was then building, 18 years after the founding of Cumx, and about 108 after the taking of Troy. Critheis being near her unes, went one day to a feftival, which the town of Smyrna was celebrating on the banks of the river Meles; where her paies coming upon her, fie was delivered of Homer, whon the called Melefigenes, becaule he was born on the banks of that river. Having nothing to maintain her, The was foreed to fpin: and a man of Sinyrna called Pbernius, who taught literature and mulic, having often feen Critheis, wholudged near hinn, and being pleafed with her houfewifery, took her into his houle to fpin the wool he received frum his !chulars for their fehooling. Here me behaved herfelf fo modekly and difereetly, that Phemins married her: and adoped her fon, in whom he difonvered a wonterful genous, and the belt natural difpotation in the world. Miter the death of Phemius and Critheis, Homer fisceeded to his father-in-law's forture and fehoul: and was admired, not only by the inhabitants of Smyrna, but by Alrangers, who reforted from all parts to that place of trace. A mipmatler called Mentes, whes was a man of learning and a laver of poetry, was fo taken with Homer, that he perfuaded thon oo leave his fchonl, and to travel with him. Hamer, wha had then beran his poem of the lliad, and thonght it of areat confequence to fee the places he fould have occainon to treat of, embraced the opportunity. He cmbarked with: lrlentes, and during their feveral voyages never failed carerutly $+K$

Homer.
$\underbrace{\text { Homer. }}$

## H O M [ 634 ] H O M

to note down all that he thouglit worth obferving. He travelled into Exypt ; from whence he brought into Gruce the names of their gods, the chicf ceremonies of their wormip, and a more inproved knowledge in the arts than what prevailed! in his own country. He vifited Africa and spain: in his return from whence he touched at lthaci, where he was much troubled with a theu; falling upon his eyes. Mientes being in hatte to take a turn to Leucadia his uative country, Ieft F omer well reconmanded on Mentor, one of the chief men of the inland of thaca, who took all polfible care of him. There tiomer was informed of many things aclating in Thyffes, which he afterwards made ufe of in comporing his O tylley. Mentes returning to Ithaca, foum Honer cured. They embarked together; and after mach time fent in viliting the coalls of Peloponnefus and the iflands, they arrived at Colophon, where Homer was again troubled with the defluxion upon his eves, which proved fo violent, that he is faid to lave lott his fight. This misfortune made hin refolve to return to Snyrna, where he finifhed his lliad. Some time after, the ill polture of his affairs obliged him to go to Cumx, where he hoped to have found fome relicf. Here his poems were highly applauded: but when he propofed to immortalize the: town, if they would allow him a falary, he was anfweed, that " there would be no end of maintaining all the "Ourgos or "blind men;" and hence got the name of Homer He afterwards wandered through feve. ral places, and Hopped at Chios, where he married, and compofed his Odyffey. Some time after, having added many verfes to his poems in praife of the cities of Greece, efpecially of Athens and Argos, he went to Samos, where be fpent the winter, finging at the houles of the great men, with a trails of boys after him. From Samos he went to Io, one of the Sporades, with a defign to continue his voyage to Athens; but landing by the way at Chios, he fell fick, died, and was buried on the fea fhore.

The only inconteRable works which Homer has left behind him are the Iliad and Odysegy. The Batrachomyomachia, or battle of the frogs and mice, has been difputed. The hymus have been difputed alfo, and attribured by the fcholiats to Cynathus the rhapfodif: but neither Thucydides, Lucian, nor Paufanias, have fcrupled to cite them as genuiue. Many other pieces are afcribed to him: epigrams, the Eartiges, the Cecropes, the dettruction of Oechalia, of which only the names are remaining.

Nothing was ever comparable to the clearnefs and majefty of Homer's ftyle; to the fublimity of his thoughts; to the ftrength and fweetnefs of his verfes. All his images are triking; his deferiptions juft and exaf; the paffions fo well expreffed, and nature fo junt and finely painted, that he gives to every thing motion, life, and action. But he more particularly excels in invention, and in the different characters of his heroes, which are fo varied, that they affect us in an inexpref. fible manner. In a word, the mure he is read by a perfon of good talle, the more he is admired. Nor are his works to be efteemed merely as entertaining poems, or as the monuments of a fublime and varied genius. He was in general fo accurate with refpect to coftume. that he feldom mentioned perfons or things that we may not conclude to have been known during
the times of which he writes; and it was Mr Pope's opinion, that his account of people, princes, and countries, was purely hiftorical, founded on the real tranf. actions of thofe times, and by far the molt valuable piece of hitlory and geography left us concerning the thate of Greece in that early period. His geographi. cal divitions of that country were thought fo exact, that we are told of many controverfies concerning the boundaries of Grecian citics which have been decided upon the authority of his puems.

Alcibiades gave a theterician a box on the ear for not having Homer's writings in his fehool. Alexander was ravilied with them, and commonly placed them under lis pillow with his fword: lie inclofed the Iliad in the precions calket that belonged to Darius; "in order (faid he to his courtiers) that the molt perfect production of the human mind might be inclofed in the mott valuable cafket in the world." And one day feeing the tomb of Achilles in Sigxa, " Fortunate hero! (cried be), thou haft bad a Homer to ling thy victories!" Lycurgus, Solon, and the kings and princes of Greece, fet fuch a value on Homer's works, that they took the utmolt pains in procuring correct editions of them, the mott efteemed of which is that of Aritarchus. Didymus was the firf who wrote notes on Homer; and Eutathius, archbithop of Theffalonica, in the 12 th century, is the molt celebrated of his commentators. Mr Pope has given an elegant tranflation of the Iliad, adorned with the harmony of poetic numbers; and Mad. Dacier has trannated both the Iliad and Odyfley in profe.

Thofe who defire to know the feveral editions of Homer, and the writers who have employed themfelves on the works of that great poet, may confult Fabricius, in the firlt volume of his Bibliotbeca Graca.

A very lingular difcovery, however, which was made a few years ago in Ruffia, deferves to be here mentioned, together with the circumllances that attended it. Chriftian Frederic Matthxi, who had been educated by the learned Ernefli, and did credit to the inllructions of that celebrated malter by the great erudition that he difplayed, being invited to fettle at Mofow, and to $4 f$. filt in a plan of literature for which his abilities and ac. quifitions eminently qualified bim ; on his arrival at thatcity was informed, equally to his allonifhment and fatisfaction, that a very copious treafure of Greek manuferipts was depofited in the library of the Holy fynod, which no perfon in that country had either the abilities to make ule of, or the curiofity to examine. Struck with the relation of a circumfance fo unexpected, and at the fame time so peculiarly agreeable to his claffical tate, he immediately feized the opportunity that wasfortunately offered him, to explure this repofitory of hidden treafure. After having examined feveral curious books, he difcovered a manufcript copy of the works of Homer, written about the conclution of the 14th century, but evidently a tranfeript from a very ancient and moft valuable copy, which, befides the Iliad and the Odyfley, contains alfo 16 of the hymns, which have been long publifhed under the name of Homer. Nor was this all. Twelve lines of a lof hymn to Baccbur, and the hymn to Ceres, which was alfo loft, were preferved in this curious and long unnoticed manufcript. The hymn to Ceres appears to be entire, excepting a few lines towards the clofe: and it is furely remarkable,

## H O M

that a Greek poem, attributed to Homer, which had been loft for ages, hould be at length difcovered in Mufcovy, the rudeft and molt unclallical country in Europe. M. Mathri, exulting in an acquifition fo unexpected, and at the fame time fo valuable, communicated it, with fingular difinterettednefs, to his learned friend M. Ruhnkenius, with whofe talents and extraordinary erudition he was well acquainted, that this gentleman might prefent it to the world without thofe delays which would probably have retarded the publication of it at Mofoow. He was rather induced to employ M. Ruhnkenius in the publication of this curious and beautiful remnant of antiquity, becaufe he knew that this gentluman had been particularly engaged in the ftudy of the hymns of Homer, in order to give the public a complete edition of them. The hymn to Ceres, and the fragment of the hymn to Bacclus, were printed in 1780 at Leyden, under the care of M. Ruhnkenius; who has added fome very valuable notes and obfervations on the hymn to Ceres. which tend to illuflrate its beauties, and to throw a light on fome of its obfcurities. The learned editor obferves, that nothing was more diflant from his expectations than the difcovery of this hymn to Ceres. He knew indeed that a poem bearing that title, and afcribed to Homer, exitted in the fecond century ; but as it had long been confidered as irretrievably loft, he had formed no hopes of ever feeing it refcued from the obicurity to which it had been configned. He acknowledges, that he has many doubts with refpect to the high and illuflrious onigin afcribed to this hymn: but as no pofitive external evidence can be produced todetermine the puint, he chooles to ret his argument on what appears to him the more certain ground of internal proof; and obferves, that though the poem be exquifiely beautiful, yet that it is evidently deficient in fome of Homer's more ltriking and predominant characteriftics. It wants his energy and fpirt ; that vigour, that infpiration, which animate and give an irrefultible power, as well as an enchanting beauty, to the poems of that fubline and inimitable bard. This opinion, as we have already feen, hath been given by nther critics of all the hemns of Homer. But though M. Ruhnkenius is not inclined to attribute the hymn of Ceres to Homer, he yet acknowledges, that the flructure of its language is founded on the model of that great poet, and le feefitates not to give i: the honour of very high antiquity. He is of epmion, that it was written immediately after Homer, or at lealt in the age of Hetiod: and he congratulates the age on the difcovery of fu curious a poem, rcicued by mere accident from the darkelt retreats of oblivion, and perhaps but at a night diflance from inevitable perdition. He deems it to be an acquifition, not only calculared to gratify the curiofity of the connoifears in claflic antiquity, or to entertain thofe lovers of Greek poetry whofe ludies are made fubfervient to a refined and elegant fpecies of amufement, but he alfo elleems it to be of particular ule to the critic, as it tends to illuthate fome obfcure palfages both in the Greek and Latin poers

HOMER, Omer, or Chomer, a Jewih meafure, containing the tenth part of the epha. See Corus and Measurf.
homesoken. Sce Hamesfores.
HOMICIDE, fignifies in general, the taking away of any perfou's life. It is of three kinds; julifable,
excuftuble, and felonious. The firt has no thare of Homicide. guilt at all; the fecond very little; but the third is the highert crime againll the law of nature that man is capable of committing.
I. Jultifiable homici le is of divers kinds.
t. Such as is owins to fome unavoidable necentity, without any will, intention, or defire, and without any inadvertence or negligence, in the party killing, and therefore without any fhadow of blame; as, for inftance, by virtue of fuch an office as obliges one, in the execution of public juflice, to put a malelactor to death, who hath forfeited his life by the laws and verdict of his country. This is an act of neeelfyy, and even of civil duty; and therefore not only jusititable, but commendable, where the law requ res it. Bu: the law mult require it, otherwife it is not juftifiable: therefore wantonly to kill the greatef of malefactors, a felon, or a traitor, attainted or outlawed, deltherately, uncompelled, and extrajudicially, is murder. And farther, if judgment of death be given by a judge not authorized by lawfal commilfion, and execution is dionc accordingly, the judge is guilty of murder. Alfo fuch judgment, when legal, mult he executed by the proper officer, no his appointed deputy; for no one elfe i. required by law to do it, which requitition it is tha juItifies the homicide. If anuther perfon doth it of his own head, it is held to be murder: even though it be the jur ge himfelf. It mult farther be executed, firvato juris ordine; it mutt purfue the fentence of the court. If an officer beheads one who is adjudged to be hanged, or vice verfa, it is murder: for he is merely minitterial, and therefore ouly jullified when he acto under the authority and compulfion of the law. But, if a heriff changes one kind of punihment for another, he then atts by his own authority, which extends not to the commiffiun of humicide : and befides, this licence might occalion a very grofs abufe of his power. The king indeed may remit part of a fentence, as in the cale of treafon, all but the beheading: but this is no change, no introduction of a new punilisment; and in the cafe of felony, where the judyment is to be banged, the king (it hath been faid) cannut legally order even a peer to be behcaded.

Again: In fume cafes homicide is jullifiable, rather by the permilfon, than by the abfolute command, of the law: wher for the advancement of public juflice, which without fuch indemaification would never be carried on with proper vigour ; or, in fuch inflances where it is committed for the prevention of forne atrocious crime, which cannot otherwife be avorded.
2. Homicides, committed for the adraniement of public juflice, are, 1. Where an officer, in the wention of his office, either in a civil or criminal cale, kills a perion that afluits and refitts him. 2. It in officer, or any private perfon, attempts to take a :man charged with felony, ana is relifed: and, in the endeavour to take him, kills him. 3 ln cafe of a riot, or rebellicus affembly, the officers endeavouriag to difperfe the mob are jultinisble in killing them, both at common law, and by the riot act, 1 Geu. I. e 5 . 4. Where the prifoners in a gaol, or going tuzat, alfault the gaoler or officer, and the in his defence kills any of theni, it is jutiliable, for the fake of prevent. ing an efcape. 5. If trelpafters in forctiz, parks, chafes, or warreus, will not iurrender thenfflve to the keepers, they may be $\mathrm{n}_{\mathrm{ain}}$; by virtue of the 'tatute 4 K 2 21 Ed

Homastice. 21 Edward I. A. 2. de mallfagoribus in parcis, and $3 \&+$ W. E M. c. 10. But, in all the fe cafes, there mat be an ayparent necellity on the ufficer's fide ; vis. that the parte could not be anelled or appechended, the rion could not lee fuppreffed, the pritoners could not lie kept in hohd, the deer-tlealers could not but eforpe, wakfs wheh homicide were comaited: wherwife, without fuch abfolute acceflisy, it is not julti Eable. 6. If the champi ns in a that by batte killed eilher of them the other, fuch hounicide was jultitiable, and was impuied to the jul julgmeat of Gol, who was the erey prefumed to have decided in favour of the truth.

3 In the next fiace, fuch homicide as is commitwed for the framain of any furcitle and atrocious srime, is juitilible by the law of nature: and alfor by the law in lingland as it Aowd to early as the thine of Bracton, and as it is fince declared by llat. $2+11$. I 111 . c. 5. If any perna atempts a rubbery or murier of ano:her, watco pis to beak open a houfe in: the might. tiage ( Mhich extends alm to an atten:pt to burn it). and hat lo kilied in furh attempt, the flayer that the angritud and dicharized. Whis reacles a it to any

 tim, whids it canics with an aterep of robery afs. So the Jwith l.w, w! ich puntant no thett wha death, make homsicic o dy jubintien cate of

land, like that of every other well-regulated commu- Ftomicit nity, is too tender of the public peace, too careful of the lives of the fubiecte, to adopt fa contentious a $\int y$ Atm; nor will fuffer with impunity any crime to be prevented by death, unle's the fanne, if cumaitted, would alfo be punifbod by death.

In there intanues of jufitable homicide, it may be obferved, that the ndyet is in no kind of fallt whatfoever, not even in the minurcil dagree: and is thesefore to be totally acquited and dincharged. with commendation rather than blame. But that is not quite the cafe in excufolle homicide, the very name whereof imperts fome faule, fome error, or omshon; fo trivial, huwever, that the lawe excules it from the guilt of fleny, thongh in Atrietnefa it judges it deferving of fome hate degree of panimaner.
II. 1:xcufable humicide is of two forts; either per infortunium, by mifadventare; or fe deferidends, upon a princeple of hit prefervation. We will firt fee wherein theie two fpecies of hemnicide are dilinet, ard then wherein they as ree.

1. Homicide fer inforturiun, or mifadventure, is where at man, dons a lawfol act, withour any intenbion of nurt, bufortunately kitls another: as where a man is at work with a hatchet, and the head thereof Sits off and kills a Hander-by; or, where a perfon, qualitied to keep a gun, is thooting at a mark, and undelisucdly kills a man: for the act is lawful, and the cficet is merely accidental. So where a parent is mud rately correeting his child, a malter his apprenthe or feitla;, or an clicer punthing a criminal, and Lappen to occafion his death, it is unly miladventure; fur the act of correction was lawful : but if he exceeds the bownis of moderation, cither in the manaer, the in Rrument, or the quan ity of punfoment, and death erifucs, it is mandagher at leal, and in tome cales (according to the circamlancts) marder; for the act of inmondeate cornction is malaful. 'Thus by an edice of the eaperor Contantine, when the rigyur of the Romais law with regard to flaves began to relax and fufien, a mafter was alioned th ctaltive his lhave whels ruch and impuifunent, and it dath accidentally cafucd, he was gsity of no crame: but if he flruck him with a club or a flone, and thereby uccationed has death, or $1 t$ is any wher yes groffer manance "innockvale fuo jure utatar, tunc reas bomicidia fre."

Lut to procecd. A tilt or turnament, the martial diverfion of our anctors, was hawever an unlawful ast ; and fo are buxing and liword-playing, the fucceedioy amufencat of their polterity : and therefore, if a knight in the former cal:, or a gladator in the latiet, be killed, fuch killing is felony of manfaughter. But if the king command or permit fuch diver. fiom, it is faid to be only mifadventure; fur then the act is lawful: In like manaer as, by the laws both of Athens and Ronne, he who killed another in the pancratium, or public games, authonfed or permitted by the thate, was mot heid to be guil.y of homicide. Likewife to whip another's bote, whercby he rune over a child anathilho thim, is hedd to be aterdental in the tider, for he has dome nothing baldawiul ; but manlangleat in the perfon who whipped han, tor the adr was a trefinis, and at bett a pate of tolencts, of inevitally dungeruas confequace. the in general.

## H O M

other impediment ; or as far as the fiereenefs of the Homicite. alfalt will permit him; for it inay be fo herce as not 10 allow him to yield a ftep, with manifill danger of his life, or enormous bedily harta; and then in lus defence he may kill his afialant intantly. And this is the doctrine of univerfal juttice, as woll as of the mu. nicipal law.

And, as the marner of the defence, fo is alfo the time to be condidered: for if the perfon affauted doen not fall upon the asgereffor till the affray is s, eer, or wenen he is ruming away, this is revenge and not defence. Neither, under the colour of felfodefence, with the law pernit a man to fereen himfelf from the gult of deliberate murder: for if two perfons, A and li, astee to fight a duel, and A gives the tirflomet, and B retreats as far as he fafely can, and then kllys. 1. this is murder; becaufe of the previous malice and concerted defign. But if $A$ upon a fudden quarrel af fants 1 B lirt, and, upon I's returning the allcult, A really and bona folle flies; and, being driven to the wall, turns agan upon B and kills him; this may be fe defendenk, according to fome of our writers; thongh others have thought this opivion too faverurable: inafinuch as the necefinty, to which he is at laft reduced. originally arofe from his own fault. Under this excufe of telf-defence, the frimeipal civil and narual iclations are comprifended: therefore, maller and fervant, parent a d chiikl, hufoand and wife, killing an affilant in the neceffiery defence of each other refpectionly, are excufed ; the act of the relution affithing being contrucd the fame as the act of the party hirrelelf.

There is one fpecies of homicide fe defontend, where the party fana is cqualiy innocens as he wher occafons his death: and yet this homicide is aife excufalic foon the great univerfal principle of felf prefervation, whie h prompts every man to lave his oun life preferable un that of another, where one of them mul inevirably perim. As, among others, in that cafe mentionse by lord Bacon, where two perons, being inapwruhal, and getiong on the fame plank, but finding is the atile to fave them both, one of then thrats the nether hom it, whereby the is drewned. He whu thms preierves his usm life as the expence of another man's, is exeufable through unavoidable necoffey, and the prisiciple of feif defence; fince their b, th remaining on the fane weok plank is a mutual, though inlmecret, attempt $u_{p}$ on, and an endangering of, cach other's life.

Let us next take a visw of thate circumathaces wherein thete two fuecies of honicide, by miladienture and felfodefonce, agree; and thule are in their blame and panihninem. Fur the law fets fo hish a valas upan the life of a man, that it always interds frome swow haviour in th: perfin whom takes it away, unlefis be the command or exprefepermifion of the law. In the cafe of mifadrentwe, whetinnes aegligence, or at leall a want of fulfivient caat in in him who way for unfortanate as to commut it; who therefore is not atlogether faullets. And as to the neculfity which ex-
 ce: intitles it neodfas culabiais, and thereby di in guib es is from the formet neeffey of killing a thef or a malefact,r. For the law intends that the quarel or alitult alole from fome naknown wrong or tome provocation, either in wrord or deed: and fince in quarr is

## H O M

Homicide. quarrels both parties may be, and ufually are, in fume fault; and it farce can be tried who was originally in the wrong ; the law will not hold the furvivor eutircly guiltefs. But it is clear, in the other cafc, that where I kill a thicf who bucaks into my huuke, the original default can never be upon my fidc. The law belides may have a farther view, to make the crime of honiciưe more odious, and to caution men how they venture to kill another upon their uwn private judgment; by ordaining, that he who flays his neighbour, without an exprefs wartant from the law fo to do, fhall in no cafe be ablolutcly free from guilt.

Nor is the law of England ingular in this refpect. Even the flaughter of cucmies requited a folemn purgation annong the Jews; which implies, that the death of a man, however it happons, will leave fome Han belind it. And the Molaieal law appointed ecrtain cities of refuge for him " who killed his netghbour unawares; as if a man goeth into the wood with his neighbour to hew wood, and his hand fetcheth a throke with the ax to cut down a tree, and the head flippeth from the helve, and lighteth upon his neighbour that he die, he thall flee into one of thufe cites and live." Hut it feems he was not ledd wholly blamelefs, any more than in the Englith law; filue the avingor of blood might flay him before he reached his afylum, or if he afterwards firred out of it till the death of the high prielt. In the inporial law likewife calual homicide was exculed, by the indulgence of the emperor figned with his own lign manual, "adnotatione princi. fis;" otherwife, the death of a man, howevic committed, was in fome degree puniflable. Among the Greeks, homicide by misfortune was expiated by voluntary banifiment for a year. In Saxony, a tine is paid to the kindred of the flain; which allo, among the weftern Goths, was little inferior to that of volumary homicide : and in France, no petfon is ever abfolved in eafes of this uature, without a largefs to the poor, and the charge of certain mafles for the foul of the party killed.

The penalty inflicted by our laws is faid by Sir Edward Coke to have been anciently no lefs than death; which, however, is with reafon denied by ldter and more accurate writers. It feems rather to have confifted in a forfeiture, fome fay of all the goods and chattel, others of ouly a part of them, by way of ine or queregild: which was probably dilpufed of, as in France, in pios $u f u s$, according to the humane fuperflition of the times, fur the benefit of bis foul who was thus fuddenly fent to his account with all his im. perfections on his head. But that reafon laving long ceafed, and the penalty (efpecially if a total forteiture) growing more fevere than was intended, in proportion as perional proputy has become mure walide rable, the delinquent has now, and has had as early as our records will reach, a purdon and writ of ret.nution of his goods as a matter of courfe and right, only paying for fuing out the fance. And, indeed, to prevent this expenfe, in cafes where the death has notorivully happened by mifadrenture or in felf-defence, the judges will ufually permit (if not direct) a general verdict of acquittal.
III. Felonious homicide is an aet of a very different nature foom the former, being the killing of a human sreature, of any age or fex, without jultification or
excufe. This may be done either by killing one's felf, or another man: for the confideration of which, fee the aiticles Shle Murder, Murder, and Manslavghter.

IHOMILY, in eeclefiatical writers, a iermon or difcourfe upon fome point of religion, delivered in a plain manner, fo as to be eafily underitood by the common people. The word is Greek, owisis ; formed of anct, catus, " affenbly or council."

The Greek homily, fays M. Fleury, fignifies a familiar difcourfe, like the Latin Sermo; and difcourfes delivered in the chureh took thefe denominations, to intimate, that they were not harangues or maters of oltentation and flomrifh, like thofe of profane urators, but famuliar and uleful difcourfes, as of a matter to his diferples, or a father to his chuldren.

All the homilies of the Greck and Latin fathers are compoled by billops. We have none of Tertullian, Clenens Alexandrinus, and many other learned perfons; becaule, in the inrlt ares, none but bilhops were admitted to preach. The privilege was nut ordinarily alluwed to pricits till toward the fifih century. St Chryiultom was the firt prefoyter that preached Itatedly. Origen and St Augultine alfo preached; but it was by a peculiar licence or privilege.

Photiun ditunguithes bomi'y from fermon; in that the homily "as performed in a mure familiar manner, the prelate interrogating and talking to the people, and they in their turn anfwering and interrogating him, fo tnat it was properly a converfation; whereas the fermon was delivered with more form, and in the pulpit, after the mamer of the orators.
The practice of compiling homilies, which were to be committed to memury, and recited by ignorant or inculent priefts, commenced towards the elofe of the Sth century ; when Chartcmagne ordered Paul Deacon and Alcuin to form homilies or difcourfes upon the Gofpels and Epittes, from the ancient docturs of the church. l'hes gave rife to that famous collection inttied the Honiliarium of Charlcmagne, and which being tullowed as a model by many productions of the fame kind, compofed by private perfons, from a principic of pious zeal, contrabuted much (fays Mofhein) to nounth the mdolence, and to perpetuate the ignorance of a woritilefs clergy.

There are thth extant leveral fine homilies, compofed by the ancient fathers, particularly st Chryfottom and se Gregury.

Clementine Homures, in ceelffafical hittory, are mineteen tomithes an úreek, publithed by Cutelerus, with two letiero preixad; one of them written in the name of Peter, the wher in the name of Clement, to Janes buth of Jeruatem; in which laft letter they are mtitled Clement's Epitome of the Preaching and Travels of Puter. According to Le Clerc, theic homiles were compofed by all Livionite in the fecond century; bui Montaucon fuppoles that they were forged luag atter the age at si athandius. Dr Lardner dppucheads, that the Clemembe homilies were the orignat or Liat edtion of the Recognitions: and that they are the fane midh the work cenfured by Eulebus under the tute of Dislogues of P'eter and Applon.
homine repleglando, a writ for the bailing of a man out of prifon when he is confined without commandment of the king or his judges, or for any caufe
that is repleviable But this writ is now feldom ufed; a writ of babeas corpus being fued out on the neceffary occafions.

HOMMOC, a name given hy mariners to a hilloc or fmall eminence of land, refembling the figure of a cone, and appearing on the fea-coaft of any country.

HOMO, man, is ranked by Linnxus under the or der of primates; and characterifed by having four parallel foreteeth both in the upper and lower jaw, and two mammax on the breaft. The fpecies, according to this author, are two, viz. the homo fapiens, and the homo troylodytes.

He fubdivides the homo fapiens into five varietics, wiz. the American, the European, the Aflatic, the A. frican, and what he calls the monfrous. See Mas.

The troglodytes, or orang outang, is a native of Ethiopia, Java, and Amboina. His body is white; he walks erect; and is about one-lalf the ordinary lutman lize. He generally lives about 25 years. He conceals himfelf in eaves during the day, and fearches for his prey in the night. He is faid to be exceed. ingly fagacions, but is not endowed with the faculty of fpeech. See Troglodytes, Simia, and Comparatife Anatomy.p. 25\%, col. 2.
homogeneous, or Homogeveal (compofed of the Greek aros like, and reoos kind), is a term applied to various fubjects, to denote, that they eonifit of $f_{1}$ milar parts, or of parts of the fame nature and kind: in contradiflinction to ketcrogeneous, where the parts are of different natures, \&cc.

HOMOLOG TION, in the civil las, the act of confirming or rendering a thing more valid and fo. Iemn, by publication, repetition, or recognition thereof. -The word comes from the Greek wescorix "confent, aftent;" formed of opre fimilis. "like," and r. roe, of noziv, ficere, "to fay;" $q$. d. to fay the fame thing, to confent, agree.

HOMOLOGOUS, in geometry, an appellation given to the correfponding fides and angles of fimilar figures, as being proportional to cach other.

HONAN, a province of China. bounded on the north by that of Ptecheli and Chanfi, on the welt by Chan $f_{1}$, on the fouth by Houquang, and on the ealt by Chantong. Every thing that can contribute to render a country delightulul is found united in this pro. vince; the Chinefe therefore call it Tong had or the middle flower: it is indeed lituated almont in the certie of China. The ancient emperors, invited by the mildnefs of the climate and the beauty of the countiy, fixed their refidence here for forne tinue. I'lie abun dance of its fruits, paftures, and com, the effeminaey of its inhabitants (who are accounted extremely voluptuous), and la[t]y, the cheapnefs of provifions, have no doubt prevented trade from being fo flourihing here as in the other provinces of the empire. The whole country is flat excepting towards the weft, where there arifes a long chain of mountains, covered with thick forefts; and the land is in fuch a high thate of eultiva. tion, that thofe who travel through it imagine they are walking in an immenfe garden.- Befides the river Hoangho, which traverfes this province, it is watered by a great number of fpring- and fountains; it has alfo a valuable lake, which invites to its banks a prodigious number of workmen, becaufe its water has the property of communicating a luftre to lilk, which can.
not be imitated. Exclufive of forts, caftes, and places of ftrength, this province contains eight fois or cities of the firt clafs, and 102 of the fecond and third. In one of thefe cities named Nanyany, is found a kind of ferpent, the Rkin of which is ma ked with fmall white「pots: the Chinefe phylicians Iteep it in witie, and ufe it afterwards as an excellent remedy againt the pals.

Honan-Fos, a city of the abore province, fituated amidit mountains and between thrte rivers. The Chinefe formenty believed this city in be the centre of the carth, becaufe it was in the middle of their empire. Its juridtistion is very extenlive : for it comprehends one eity of the feeond clafs and thirteen of the third: one of thefe cities named Teng-fong-hien, is famous on account of the tower erected by the celebrated Tcheoukong for an oblervatory; there is Alill to be feen in it an inftrument which he made ufe of to find the thadow at noon, in order to determine the latitude. This attronomer lived above a thoufand years before the Chriftian era, and the Chinefe pretend that he invented the mariner's compafs.

HONDEKOOTER (Melchior), a famous Dutelz painter horn at Utrecht, excelled in painting animals, and efpecially birds. His father and grandfather were of the fame profeffion, and their fubjects the fame. He was trained up to the art by his father; but furpaffed not only him, but even the beft of his cotemporaries in a very high degree. Till he was feventeen years of age, he continned under the direction of his father, and accuftomed himplf to paint feveral forts of birds; but particularly he was pleafed to reprefeat cocks, hens, dueks, chickens, and peacocks, which he deferibed in an elvgant varicty of actions and attitudes. - After his father's death, which happened in 16,53 , he received fome influctions from his uncle John Baptift Wecninx ; but his principal and beft indtructor was nature, which be fudied with intenfe application. His pencil was wonderfully neat and delicate; his touch light ; his colouring exceedingly natural, lively, and remarkably tranfparent; and the feathers of his fowls were expreffed with fuch a fielling foftnefo, as might readily and agrecably deceite the eye of any Ipectator. It is reported that he had trained up a cock to lland in any attitude he wanted to defcribe, and that it was his cultom to place that creature near his eafel : fo that at the motion of his hand the bird would fix itfelf in the proper polture, and would con: tinue in that particular polition without the fmallett perceptible alteration for feseral hours at a time. The landfrapes which he introduces as the back grounds of his pictures, are adapted with peculiar judgment and. kill. and admirably finifhed; they harmonize with his fubject, and always increafe the force and the beauty of his principal objects. His touch was very fingular, in initating the natural plumage of the fowls he painted; which not only produced a charming effect, but alfo may prove ferviceable to an intelligent obferver, to affit hin in determining which are the geauine works of this mafter, and which are impofitions. His pictures fell at a high price, and are much fought after. He died at Utrecht in 1695 , aged 59.

HONDURAS, a province of North America in New Spain, lying on the North Sea, being abous $3^{-2}$ miles in leugth, and 200 in breadth; it was difcover-

Hondura*
ed by Cbriftopher Culumbus in the year 5502 . The Englih have been pofififed of the logwood councry on the hay of Honduras a great whike, and cut large quantities every year. The Nofquito native Americans live in the eallern parts; and being in.!cpendent of the Spaniards, have entered inta treaties with the Engliha, and ferve them in feveral capacities. This province is watered by feveral rivers, which enrich the comatry by their inundations; and it is very fertile in Indiancorn. It is faid the re are fome mines of gold and filver in this prowince. Valadolid is the capital town.

HONE, a fine kind of white flone, ufed for fetting razors, pen-knives, and the like.

HONEY, a fweet vegetable juice, collected by the bees from the flowers of varinus plants, and depofited in the cells of the comb; from which it is extracted either by fontaneous percolation through a fieve in a warm place, the comb being feparated and laid thereon, or by expreflion. That whish runs ferntameonly is puer than that which is expreffed, a quantity of the wax and other matters beine forced out along with it thy the prefliure. The befl fort of boncy is of a thick corfitence, a whitifh colour inclining to fellow, an adereathe finell, and pleafant tatte : hoth the colsur and flavour are faid to differ in fonne degree, according to the plants which the bees collect it from. It is fuppofed that honeyis menely the juice of the fower perfpiring, and becoming infpiffated thereon; and that the bee takes it up with its probofcis, and carries it to he depolited in its waxen cells, with which the young bees are to be fed in fummer, and the old ones in wimter: but it is certain, that honey can be procured by no other method of colle eting this juice than by the bees. The huney wronght by the young bees, and that which is permited to run from the comb without heat or putflure, is white and pure, and called virgin's honcy. The honey of old bees, and that which is fored from the conb by heat or preflure, is yellow, from the wax. Honey produced where the air is clear and hot, is better than that where the air is variable and cold. - The heney of Narbonne in Fiance, where rofomary abounds, is faid to have a very manifen flavour of that plant, and to be imitable by adding to other honcy an infufion of rofenary flowers.

Honey, confidered as a medicine, is a very ufful detergent and aperient, powerfully diffolviň vitcid juics, and from,ting the expectoration of tough platem. In fume particular condtitutions it has an inconvenience of griping, or of proving purgative; which is faill to be in come meafure prevented by previorfly builing the honey. 'This, however, with all conlltutions, is by means effectual; and the circuntlance mentioned has had fo much weight with the Edisturgh college, that they do not now employ it in any prefaration, and have entircly rejected the mella medocata, feblituting fyrups in their place: but there can te no doubt that honcy is very uleful in giving form to different atichs, although there be fome individuals with whom it may difagter. In order, himever, to cbtain the geod effects of the honey itfilf, it muit be ufod to a coufiderable extent, and as an anticle of diet. The following remarkable istlances of the good tikes of honey in fome allmatic cates, given by Dr Munro in his Mulicaland lhamacentical $\therefore 2: 5$

Clemifry, deferve to be bere inferted. "The late Dr John Hume, one of the comnithuners of the fick and hurt of the royal nary, was for many pews vioLeutiy allacted with the allma. Haring taken many medicines without recciving relief, he at lath refolved to try the effects of honcy, laving long hao a great opivion of its virtues as a pectoral. For two or three years he ate fome ounces of it dails, and got eutirely free of his afthma, and likewife of a gravelly complaint which he had long been afficted with. About two years after lie liad recovered his heilth, when he was fitting onc day in the office for the lick and hurt, a perfoa labouring under a great diffeulty of breathing, who looked as if he could not live many days, came to him, and aked him by what means he had been cured of his athma? Dr Hume told hias the particulars of his own cafe, and mentioned to him the means by which he had found relicf. For two years after he heard nothing of this perfun, who was a ftranger to him, and had feensed fo bad that he did not jmagine that he could liave lived many days, and therefore had not even alked him who he was; but at the end of that period, a man feeningly in good health, and decently dreffed, came to the lick and hurt office, and returned him thanks for his cule, which he affured him had been entirely brought about by the free ufe of honey."

Honer-Dezw, a fweet faccharine fubtance found on the leaves of certain trees, of which bees are very fond, by the hufoandmen fuppofid to fall from the heavens like common dew. This opinion hath been refuted, and the true origin of this and other faccha1 ine dews thown by the Abbe Bolfier de Sauvages, in a memoir read before the Society of Sciences at Montpelier. "Chance (fays the ribbe) afforded me an opportunity of feeing this juice in its primitive form on the leaves of the holm oak: thefe haves were covered with thoufands of fmall round globules or drops, which, without touching one anether, feemed to point out the pore from whence each of them had piuceeded. My talle infurmed me that they were as fiweet as honey : the honey-dew on a neighbouring bramile did not refemble the furmer, the drops having ran together; owing either to the moillure of the air which had diluted them, or to the heat which had expanded them. The dew was become more vifcous, and lay in large drops, covering the leaves; in this form it is ufually feen.
"The oak had at this time two forts of leaves; the old, which were llrowg and irm; and the new, whech were tender, and uenly come forth. The honey-dar was fuund only on the old laves; though thefe were covered by the new oncs, and by that means theltered from any "oithre that could fall from above. I obferved the fame on the old leaves of the bramble, while the new leaves were quite free from it. Another prout that this dew proceeds from the leaves is, that other neighbouring trees not furnifhed with a juice of this kind had no moillure on them; and particularly the mulberry, which is a very panticular circumblance, for this juice is a deadly poifon to filkworms. If this juice fel! in the form of a dew, mill, or fog, ic would wet all the leaves without dittinction, and every part of the kaves, under as well as upper. ILeat may have fome thare in its production: for ${ }^{1}$
though

T. though the common heat pronotes only the tranfpr ration of the more volatile and fluid juices, a fultery heat, efpecially if reflected hy clouds, may io far dilate the veffel as to produce a more vifcous juice, fuch as the heney dew.
"The feenod kind of honey-dew, which is the chief refontec of bees after the fpring-fowers and dew by tranfpiratiun on leaves are paft, owes its urifill tw a fmall infect called a i ine freter; the exerement ijeco. ted with fome forse by this iafeet makes a part of the mot delieate bonsy known in nsture (ite Arins). Thefe wine fretters reft duing feveral mouths on the barks of particular tices, and extract their food by piercing that bark, withour hurting or deforning the tree. Thefe infects allo caufe the leaves of furne trees to curl $u_{i}$, and produce galls upou others. They fettle on branches that are a year old. The juice, at firft perhaps hard and crabbed, becomes, in the bowels of this infect, equal in fweetnefs to the buney ubsained from the flowirs and leaves of vegetables ; except ing that the Aowsers may communicate fome of their effential oil to the honey, and this may give it a peculiar favour, as happenced to infele by plaming a hedge of rofemary near my bees at Sauvages: the honey laas tatted of it ever fince, that flurub continuing long in flower.
" 1 have obferved two fpecies of vine-fitters, which live unfheltered on the bark of young branches; a larger and a lefter. The leffer fpecies is of the colonr of the bark upon which it feeds, gencraily green. It is chiefly dilinguinaed ly two horns, or Atraight, inmoveable, 周fliy fubitances, which rife perpendicularly from the losser fites of the b=lly, one on each lide. This is the fpecies which live on the young branclies of bram ble and elder. The larger fpecies is double the fize of the other; is of a blackifh colour: and inftead of the horns which diflinguif the other, have in the fane part of the ikin a finall button, black and ihining like jet. "The buzzing of bees in a tult of holn-oak, made me fufpect that fomething very interelling brought fo many of them thither. I knew that it was not the feafon for expecting honey-dew, nor was it the place where it is ufually found ; and was furprifed to find the tuft of leaves and branches covered with drops which the bees collected with a humming noife. The form of the drops drew my attention, and led me to the following difcovery. Inttead of being round like drops which had fallen, each formed a fimall longin oval. I foon perceived from whence they proceeded. The leaves covered with thefe drops of honey were fituated beneath a fwarn of the larger black winefretters; and on obferving thefe infects, I perceived them from time to time taife their bellies, at the ex. tremity of which there then appeared a fmall drop of an amber colour, whicls they inftantly ejected from them to the diftance of fome incles. If found by tafting fome of thefe drops which I had catebed on my hand, that it had the fame flavour with what had before fallen on the leaves. I afterwards faw the fmaller fpecies of vine-fretters eject their drops in the fane manner. This ejection is fo far from being a matter of indifference to thefe infects themfelves, that it feems to have been wifely inflituted to procure cleanlinefs in each individual, as well as to preferve the whule fwarm

Voe. VIII. Part II.
from defruetion; for prefling as they do ore upon inother, they would atherwife foon be glaed together, and renderd incapable of tiring the drops thus fpurted out fall upon the ground, if not intercepted by kaves or branches; and the fots they make on flones remain fone time, unlefs wafleed off by rain. This is the only hancy-dew that falls; and this never falls from a greater height than a branch where thefe: infects can clufter.

- " It io now cafy to account for a fhenomenom whish formerly puzzled race greatiy. Wa!king under a limetree in the king's garden at Paris, I felt my hand wetted with little drope, which I at frit took for fimall rain. The tree indecd fhould have foltered tre from the 1 ain, but ! cfeaped it by going from under the tree. A feat placed neat the tree honee with the fe drops. And being then unacquainted with any thing of thio kind, except the honey-dew found on the traves of fome particular trees, I was at a lofs to conceive liow fo glutinous a fubltance could fall from the leares in fuch fimall drops: far I knew that rain could not overcome its natural aitracion to the leaves till it became pretty large drops; but I lave fuce found, that the lime tric is very fubject to thefe vine-fretters.
"Bees are not the only infeets that feaft upon this honey; ants are cqually fond of it. Led into this opinion by what naturalits have faid, 1 at firit believed that the horns in the leffer fpecies of thefe vine-fretters had in their extremity a liquor which the auts went in fearch of: but I foon difcovered that what drew the ants after them came from elfewhere, both in the larger and lefter fpecies, and that no liquor is difcharged by the horns. There are two fpecies of ants which fearch for thefe infeets. The large black ants follow thofe which live on the oaks and chefmes the lefer ants atiend thufe on the elder. But as the ants are not, like the bees, provided with the me ins of fucking up fuids; they place themfelves near the vine-fretters, in order to feize the drop the moment they fee it appear upon the anus; and as the drop renains fome time on the fmall vine fretters before they can cait it ufl, the ants have leifure to catch it, and thereby prevent the becs from baving any fhare: but the virie-fretters of the oak and chefnut being flron, er, and perhaps more pientifully Cupplied with juice, clatt the drop intlantly, fo that the larger ants get voiy litele of it.
" The vine-fretters finding the greatef plenty of juice in trees about the middle of funmer, afferd alfo at that time the greater quantity of honey; and this leffens as the featoo advances, fo that in the autumn the bees prefer it to the nowers then in $f$ afun. though thele infects pierce the tree to the fap in a thoufand places, yet the trees do not feem to fuffer at all from them, nor da the leaves lofe the $\mathrm{l}_{\text {alt }}$ of their verdure. The hufbandman therefore acts injudicioung when bc deltroys them."

 and trade in bone-lace. It is feated on the river Seine, efeape to a plase of greater fafety. The Morr then-Hon in E. Long. o. 8. N. Lat. 17. 49 .HONI soit QHemalyfensf, q. d. "Evil to him that thinks evil;" the motto of the mon noble order of the knights of the Garter. Sce Gapter.
IIONITON, a very pleafant market and borough town in Devonfhire, fituated 156 miles WV . of London, and 16 eall of Excter. It confills of about 400 houles; and has one church on a hill full half a mile from the town. and a chapel and free grammar-fethool in the town. It is well paved and lizhted, and lakes of water run through it. 'lhis place has fultered by tires greatly in 1747 and 1765. The market is on Saturday, and one fuir in July: its manufactures are ferge, and rich bone lace and edging. It was a chartered corporation by James II. Lat reverted to its old confituation on the revolation, and is now governed by a portecte who is chofen annuzlly. It firl returned nembers the 28 th Edw. I.

HONORIACE, in antiquity, an order of foldery under the ealtern empire, who introduced the Goths, Vandals, Alani, Suevi, \&ke into Spaia. Didymus and Verinianus, two brothers, had, with great vigilance and vatour, defended the paffagez of the Pyreneans againt the Barbarians for fome time, at their owa expence; but beiug at length killed, the emperor Conftantius appointed the hotoriaci to defend thofe paf. fages, who, not contented to lay them opea to all the nations of the north then ravaging the Gauls, joined themfelves to them.

HONOUR, a teflimony of efeem or fubmiffion, exprefled by words, aciions, and an exterior behaviour, by which we make known the veneration and refpect we entertain for any one on account of his dignity or merit. The word bonour is alfo ufed in genezal for the efteem due to virtue, glary, and reputation. It is alfo ufed for sirtue and frobity themfelves, and for an exaitnefs in performing whatever we have promifed; and in this lall ieafe we wfe the term, a man of bonour. But bonsar is more particularly applied to two diffe. rent kinds of virtue; bravery in men, and chaftity in women.-Virtue and Honour were deified among the ancient Greeks and Romans, and had a joint temple confecrated to them at Rome: but afterwards each of them had fepara:e temples, which were fo placed, that tro one could enter the temple of Honour without pafing through that of Virtue ; by which the Roman 3 were continually put in mind, that virtue is the only direct path to true glory. Plutarch tells us, that the Romans, contrary to their ufual cuftom, facriticed to Honour uncovered; perhaps to denote, that where. ever honour is, it wants no covering, but fhows itfelf openly to the world.

The Spanifh hiftorians relate a memorable inflance of honour and regard to truth. A Spanif cavalier in a fudden quarrel flew a Moorith geetleman, and fled. His purfiers foon loft fight of him, for he liad unperceived thrown himfelf over a garden wall. The owoer, a Moor, happening to be in his garden, was addreffed by the Spaniard on his knees, who acquainted him with his cafe, and imphored concealenent. "Eat this," faid the Moor (giving tim half a peach), "you now "d know that you may confide in my protection." He then locked him up in his garden apartment, telling him as foon as it was night te would provide for his
went into his houfe, where he had but jut ieated himfelf, when a griat crow 1, with loud lamentations, cane to Fis gate, bringing the corple of his fon, who had jult been killed by a spaniard. When the firat thoek of furprife was a litte over, h: Karnt from the deferip. tion given, that the fatal deed was done by the very petion then in his power. He mentinned this to no one; but as foom as it was dark rctired to his garden, as if to grieve alone, giving orders that none thould follow him. Then accolting the spaniard, be faid, "Chrillian, the perfon you have killed is my fon, his body is now in my honfe. You ought to fuffer; bite you have eaten with me, and I have given you my faich, which mutt not be broken." He then led the allunifhed Spaniard to his fables, mounted him on one of his fleetell horfes, and faid, "Fly far while the night can cover you; you will be cafe in the morning. You are indeed guilty of my fon's blood: bue God is juft and good; and I thatok him I am innocene of yours, and that my faith given is preferved."

This point of honour is mott religiounty obferved by the Arabs and Saracens, from whom it was adoptec' hy the Moors of Africa, and by then was brought. iuto Spain. The following inftance of Spanifa honom may ftill dwell in the memory of many living, and deferves to be handed down to the latell poflerity. In the year $17+6$, when we were in hot war with Spain, the Elizabeth of London, captain William Edwards, coming through the Gulph from Jamaica, richly laden, met with a molt violent form, in which the fhip fprung a leak, that obliged them, for the faving of their lives, to run into the Havannah, a Spanilh port. The captain went on fhore, and directly waited on the governor, told the occation of his patting in, and that he furrendered the thip as a prize, and himfelf and hio mea as prifoners of war, only requefting good quarter. "No, Sir," replied the Spanith goveruor, "if we had taken you in fair war at fea, or approaching our coatt with holtile intentions, your fip would then have been a prize, and your perple prifoners; but when, diftefled by a tempett, you come into obr ports for the fafety of your lives, we, the enemies, being men, are hound as fuch by the laws of humanity to afford telief to diftreffed men who atk it of us. We cannor even againt our enemies take advantage of an act of God. You have leave therefore to unload your fhip, if that be neceffary, to ltop the leak; you may refir her here, and traffic fo far as thall be neceffary to pap. the charges ; you may then depart, and I will give you a pafs to be in force till you are beyond Bermuda: if after that you are taken, you will then be a lawful prize; but now you are only a franger, and have a itranger's right to fafety and protection." The flip. accordingly departed, and arrived fafe in London.

A remainable inlance of the like honour is record: ed of a poor unenlightened African negro, in Captain Snelgrave's account of his voyage to Guinea. A New England foop, trading there in 1752 , left a fecond mate, William Murray, fick on thore, and failed without him. Murray was at the houfe of a black named Cudjoe, with whom he had contrated an acquaintance during their trade. He recovered; and the floop being gone, he continued with his black friend till fore cother opportunity thould offes of this geting home

In the mean time a Dutch thip came into the road, and fume of the blacks coming on board her, were treacheroully feized and carried of as their haves. The relations and friends, tranforted with fudden rage, paa into the houfe of Cudjoe, to take revenge by killing Murray. Cudjoe flopt them at the door, and demanded what they wanted. "The white men," faid thry, "have carried away our brothers and foas, and we will kill all white men. Give us the white man you have in your houfe, for we will kill him." "Nay," faid Cudjoc, "the white nen that earried away your relations are bad men, kill them when you can take them; but this white man is a good man, and you mult not kill him."..." But lie is a white man," they cried; "and the white men are all bad men, we will kill them all." "Niay," fays he, "you muft not kill a man that has done no harm, only for being white. This man is my friend, my houfe is his polt, I am his foldier, and mult fight for him; you malt kill me before you can kill him. What good man will ever eome again under my roof, if I let my foor be flained with - good man's blood!", The negroes feeing lis refola. tion, and being conviaed by his difomite that they were wrong, went away ahhamed. In a few days Mursay wentured abroad again with his friend Cudjoe, when feveral of them took him by the hand, and told him, "They were glad they had not killed him; for ps he was a good (meaning innocent) man, their God would have been very angry, and would have fpoiled their fining."

Honour, in the lean mondr, las a meaning materinlly differeat from the above, and which it is cafier to illuftrate thas detine. It is, however, fubject to a $5 y$ Atem of sules, called the haw of bonomr, conitruated by people of fantion, calenlated to facilitate their intercourfe with one ahother, and for no other purpofe. Coafcquently, nothing is conlidered as ineonfiltent with honour, but what tends to incommode this intercumfe. Henee, as Arehdeacon Palky thates the matter, profaneaefs, neglect of public worflip or private devotion, crucley to fervants, rigoons treatment of tenants or other dependants, want of charity to the poor, injuries doae to tradefmen by infolvency or delay of paymeat, with numberlefs examples of the fame kind, are accounted no breaches of honour; beeaufe a man is not a lefs agrecable companion for thefe vices, nor the worfe to deal wida in thofe concerns which are vfually tranfacted betwecn one gentleman and another. -Again, the laze of honotir being conltituted by men ocenpied in the purfuit of pleafure, and for the mutual conveniency of fuch men, will be found, as might be expected from the character and defign of the law-makers, to be, in nof inflances, favourable to the lictutious indulgence of the ataral paffions. Thus it allows of fornication, adultery, drunkenuefs, prodigality, duelling, and revenge in the extrene; and lays no ltrefs upon the virtues oppofite to thefe.

Honour or Ramk - The degrees of honour which are obferved in Britain may be comprehended under the fe two lieads, viz. nobies magoret, and nobiles minores. Thofe included uader thefirll ratk are, archbifhops, dukes, marquifes, carls, vifcounes, lifhops, and barons; which are all diflinguilhed by the refgoctive crnaments of their
cfeuteheons: and throfe of the lalt are baronets, knights, efquires, and geatlemen. There are fome authors who will have baronets to be the lafl under the firlt tank; and their reafon is, becaufe their honour is hereditary, and by patent, as that of the nobility. See Commonalty and Nobletre.

Hosouks of War, in a liege, is, when a governor, having made a long and vigorous defence, is at latt obliged to furrender the place to the anemy for want of men and provifions, and makes it one of his principal articles to march out with the honours of zuar ; that is, with flouldered arnis, drums beating, colours flying, and all their baggage, see.

AFilitary Hosorrs. All armics falute erowned heads in the moll refpeetful manner, drums beating a mareh, colours and feandards dropping, and oflieers faluting. Their guards pay no complineat, exccpt to the princes of the blood; and even that by eourtery, in the abfenee of the erowned head.

To the eommander in chief the whole line turas out without arms, and the camp-guards beat a match, and falute. To gencrals of horfe and foot, they bcat a march, and falute. Lientenaant-gcnerals of ditto, three ruffis, and falute. Major-generals of ditto, two ruffs, and falute. Brigaders of ditto, retted arms, one ruff, and falute. Colonels of ditto, refted arms, and no beating. Centinels refl their arms to all field-olliecrs, and houlder to every officer. All governors, that are not gencral officers, flall, in all plaees where they are governors, have one ruff, with refted arms; but for thofe who have no commillion as governors, no drum hall beat. Lientenant-gover:ors flall have the main-guard turned out to thens with ihouldered arms.

Irafian Hosoovs of Whar, chictly initated by mot powers in Europe, are,

To the king, all guards beat the march, and all offoecrs falate. Fiedd-marthals received with the march, and faluted in the king's abfence. General of horfe or foot, four ruffs; but if he commands in clief, a march and falute. Lieutenant-generals of horfe or Mil. Dirtz foot, commanding or not, guads beat three ruffs. Major-generals of horfe and foot, two rulls. Ollicers, when their guards are under arms, and a general makes a ligaal, mat rell to him, but not beat; when not got under arms, and a fignal made, only fland by their arins. Village gruards go uuder amns only to the king, fichemarmals, grucrals of horfe and foot, and to the genteral of the day. Generals guards go under arms only to the king, lield-marflats, and the general over whom they moma. Comunanding officers of regiments and battalions, their own quarter and rear guards to turn out; but not to other ficld-officers, unlefs they are of the day: Generals in forcign fervice, the fome.
Howseres paid by Centinels. lield-marthals; two cuntinels with ordered fire-locks, at their tent or quarters. Generals of horfe or foot; two centinels, one, with lis fireloek mouldered, the other ordered. Licutc-nant-generals; one, with firelock ordered. Majorgenerals; one, with fircloek fhouldered.

The firl batalion of guards go under amms to the king only; not to fand hy, nor daw up ia the rear of thatir arms to any other; nor to give eentincls to foreigners. Sccond and third battalions draw up behind their arms to the princes, and to field-mashals; 4 L 2
$\mathrm{H} O \quad \mathrm{~N} \quad\left[6_{4}\right.$
Hicrour but when on grenadier guards or out-pofts, they turn out, as other guards do, to the oficers of the day. They give one centinal with fhouldered arms to the princes of the blood, and to lield-mathals when they lie alone in garrifor.

Court of Hosouk. See Court of Chir,thry.
Fountain of Hovorr. 'The king is forityled, as being the fource of houours, dignities, sic. Sus Prerogative.

It is inpofible that government can be maintained without a due fubordination of rank; that the people may know and diltinguifh fuch as are fet over them, in order to yield them their due refpett and obedience; and allo that the officers themfelves, being encouraged by emulation and the hopes of fuperiority, may the betier difcharge their functions: and the law fuppofes, that no one ean be fo good a judge of their leveral merits and forvices as the king himfelf who employs thear. It has therefore entrutled him with the fole power of conferring dignitics and honours, in contidence that he will bettow them upon none but fuch as deferve then. And therefore all degrees of nobility, of kuighthood, and other titles, are received by immediate grant from the crown: either exprefled in writing, by wits or letters patent, as in the creation of peers and baronets; or by corporal inveltiture, as in the creation of a limple knight.

Fron the fame principle alfo arifes the prerogative of ertcting and difpofing of offices: for honours and offices are in their nature convertible and fynonymous. All offices under the crown earry in the eye of the law an honour along with them; becaufe they imply a fuperiority of parts and abilities, being fuppoied to be always filled with thofe that are molt able to execute them. And, on the other hand, all honours in their original had dutics or offices annexed to them : an earl, comes, was the confervator or governor of a county; and a knight, miles, was bound to attend the king in lis wars. For the fame reafon therefore that honours are is the difpofal of the king, offices ought to be fo likewife; and as the king may create siew titks, fo may he create new offices: but with this re!lrietion, that he cannot create new offices with suw fues annexted to them, nor annex new fees to old offices ; for this would be a tax upon the fubject, which cannot be impoled but by act of parlia. ment. Wherefore, in 13 Hen. IV. a new office being cieated by the king's letters patent for meaforing doths, with a new fee for the fame, the letters patent were, on account of the new fee, revoked and declared void in parliament.

Upon the fame or a like reafon, the king has alio the prerogative of conferring priviteges upon private perfons. Such as granting place or precedence to any of his fubjects, as fhall feem good to his royal wiftom: or fuch as converting aliens, or perfons born out of the king's dominions, into denizens; whereby fome very confiderable privileges of natural. born lubjects are conferred upon them. Such alfo is the prerogative of crecting corporations; whereby a number of private petfons are united and knit together, and enjoy many libertics, powers, and immunities in their politic capacity, which they were utterly incapable of is their natural,

Aluids of Howour, are young ladies in the queen's houfchold, whofe ofice is to attend the queen when the goes abroad, \&c. In England they are ixx in number, and their falary 300 l . per annun each.

Howour is particularly applied in our eufloms to the more noble kind of feignorics or lordflips, whereof other inferior lordhips or manors hold or depend. As a manor conlitts of feveral tenements, fervices, cuitoms, \&c. fo an honour contains divers manors; knights-fees, \&c. It was alfo formerly called beneficium or royal fee, being always held of the king in capite.

Honove-Point, in heraldry, is that next above the centre of the efcutcheon, divioing the upper part into two equal portions.

Howourable, a title conferred on the gounger fons of earls, the fons of vifcounts and barons; as alfo on fuch perfons as have the king's commiffion, and upon thofe who enioy places of truit and honour.

HONOURAKY, fomething done or conferred upon any one, to do him homour. See the article Honour.

Honourary is fometimes underftood of a perfon who bears or pofeifies fome polt or title, only for the name's fake, without doing any thing of the functions belonging to it, or receiving any advantage from it: thus we fay honourary counfellors, honourary fellows, sc.

Honourary is alfo ufed for a lawyer's fee, or a falary given to public profeflors in any art or fcience.

HOOD (Robin), a fanous outlaw and deer-flealer, who chicfly harboured in Sherwood foreft in Nottinghamfhire. He was a man of family, which by his pedigree appears to have had fome title to the earldom of Flurtingdom; and played his pranks about the latter end of the 12th eentury. He was famous for archery, and for his treatment of all travellers who came in his way; levying contributiona on the rich, and relieving the poor. Falling fick at latt, and requiring to be blooded, he is faid to have been betrayed and bled to death. He died in $12+7$; and was buried at Kirklees in York/hire, then a Benedictine monattery, where his graveftone is thill fhown.

## Hood. See Chaperon and Cowl.

Hood, in falconry, is a piece of leather, wherewith the head of a hawk, faleon, or the like, is covered.
Hood Iflaud, one of the MARRQussas Iflands, in the South Sea. It was difcovered in April 1774 by captain Caok, who gave it that name from the perfon who lirit faw the hadd. It is the molt northerly of the cluker, and lies in S. Lat. 9. 26. W. Long. 139.13.

HOOF, the horny fubtance that c.owers the fect of divers amimals, as oxen, horfes, \&c.

Hoor-bo:md, in farriery. See there, $\oint$ xlii.
HOOFI' (Peter Coraelius Van), an eminent hiftorian and poet, born at Amllerdam in $15 \% \mathrm{~h}$. He was lord of Muyden, judge of Goyland, and knight of the order of St Michael. He died at the Hague in 1647. He wrote, 1 . An excellent hiftory of the Netherlands, from the abdication of Charles V. to the year 1588. 2. Several Cometlies, and other works. By thefe he acquired fuch reputation, that the Flemings confidered him as the Homer and Tacitus of the Netherlands.

HOOGUES,

## $\begin{array}{lllllllllll}\mathrm{H} & \mathrm{O} & \mathrm{O} & \mathrm{H} & 1 & \mathrm{O} & \mathrm{O}\end{array}$

HOOGUESTRATTEN，a town of the Nether－ lands，in Dutch Brabant，and capital of a county of the fame name．E．Long．4．41．N．Lat．51． 25 ． HOOK，in angling，\＆e．See Fissing－book．
Hooks，in building，\＆c．are of varions furts； fome of iron and others of brafs，viz．3．Armour－ hooks，which are generally of hrafs，and are to lay up arms upon，as guns，inulkets，half－pikes，pikes，jave－ lins，\＆c．2．Cafement－hooks．3．Chimney hooks，which are made both of brafs and iron，anduf dificient fahions： their ufe is to fet the tongs and fire－hhovel againtt． 4. Curtain－hooks．5．Hooks for doors，gates，ic． 6. Double line－hooks，large and fmall． 7 ．Single line－houks， large and fmall．8．Teater－hucks of various forts． See Tenter．
－Hooss of a juip，are all thofe forked timbers which are placed directly upon the keel，as well in her run as in her rake．

Can－Hooks，thofe which being made falt to the end of a rope with a noofe（like that which brewers ule to ling or carry their batrels on ），are made ufe of for gings．

Foot－Hooks，in a thip，the fame with futtocks．
Lonf．Hooks，a tackle with two hooks；one to hitch into a cringle of the main or fore fail，in the bolt－rope at the leech of the fail by the clevz：and the other is to hitch into a flrap，which is Ppliced to the cheis tree．

Their ufe is to pull down the fail，and fuccour the tackles in a large fail and fliff gale，that all ：he fteefs may not bear upon the tack．It is alfo ufed when the tack is to be feized more fecure，and to take off or put on a bonnet or drabler．

Hook Pins，is architecture，are taper iron pins，only with a hook－head，to pin the frame of a roof or flour together．

HOOKAH，among the Arabs and cther nations of the Ealt，is a pipe of a fingular and complicated conflruction，through which tobacco is fmoked：out of a fmall veffel of a globular form，and nearly full of water，iffue two tubes，one perpendicularly，on which is placed the tobacco：the other obliquely from the fide of the veffel，and to that the perfon who fmokes applies his mouth；the fmoke by this means being drawn through water，is cooled in its faffage and ren－ dered more grateful：one takes a whiff，draws up a large quantity of fmoke，puffs it out of his nofe and mouth in an immenfe cloted，and paries the hookah to his neighbour；and thus it goes round the whole circle．The hookah is known and ufed thonghout the eaft；but in thofe pats of it where the refine－ ments of life prevail greathy，every onc has his hookah facred to himielf；and it is frequently an implement of a very colliy nature，being oi filver，and fet with precious fones：in the beter kind，that the which is applied to the mouth is very long and pliant ；and for that reafon is termed the fnake：pcople who uie it in a luxurious manner，fill the vefel threugh which the fmoke is drawn with rofe water，and it thereby re－ ceives fome of the fragrant quality of thast Ruid．

HOOKE（Robert），a very eminent Englifh mathe－ matician and philofopher，was the fon of Mr John Heoke minifter of Frefhwater in the 10e of Wight， where the was born in $1 G_{35}$ ．He very early difcovered a genius for mechanics，by making curious toys with great art and dexteritg．He was cducated under Dr

Bubby in Weilminller fehoul；where he not only ace Hookzo quired a canpetent thare of Greck and Latin，toge－， ther with an infight into Hebrew and fome other Oriental languages，but alfo made himfelf mafter of a good part of Euclid＇s clements．Abcut the year 1653 he went to Chrift－church in Oxfors，and in 1655 was introduced to the Philo「ophical Socitsy there；where， difcusering his mechanic genius，he was firt emploged to anill Dr Willis in his opera：tons in chemitry，and afterwards recomenended to the honourable Robert Boyle，Efy；whon he ferved feveral years in the fame capacity．He was alfo inaltruted in altronomy about this time by Dr Seth Ward，Savilian profefior of that feience；and from henceforward diftinguifted himfelf by many nolule inventions and improvements of the mechanic kind．He invented Ceveral altrono－ mical inftruments，for making obfervations both at rea and land；and was paticularly ferviceable to Mr Boyle in completing the invention of the air－pump． Sir John Cutler having founded a mechanic：fchool in 166，，he fetled an annual ilipend on Mr Hooke for life，intrulting the prefident，council，and follows，of the Royal Sucicty to direct him wieh refpect to the number and fubject of his lectures；and on the suth of January $t 60+5$ ，he was eleeted by that fociety curator of experiments for life，with an additional fa－ lary．In 1666 he produced to the Royal Society a model for rebuilding the city of London deftroyed by fire，with which the fuciety was well pleafed；and the lord mayor and aldermen preferred it to that of the city furveyor，though it happened not to be cme－ ried into execution．It is faid，by one part of this mo－ del of Mr Hooke＇s，it was deligned to have all the chief ftreets，as from Leeaden－hall to Newgate，and the like，to lie in exact tlraight lines，and all the other crofs－Areets turaing ou：of them at right angles， with all the churches，public buildings，markets， \＆c．in proper and convenient places．The relsuild－ ing of the city according to the act of parliament requiring an able perfon to fet out the ground to the proprietors，Mr Hooke was appointed one of the furseyors；in which employmenc he got molt part of his cllate，as appeared pretty crident foom a large iron cleft of muncy found after his death，locked down with a key in it，and a date of the time，which mowed it to have been fo fhat up abuse 30 years．－ Mr Oldenburgh，fecretary to the Royal Society，dying in 1677，Mr Hooke was appointed to fupply his place，and began to take minutes at the mectiar in October，but did not publith the Tranfactions．In the begimning of the year $\mathbf{6 5 7}$ ，his brother＇s daugh－ ter，Nrs Grace Hooke，who had lived with him fo． veral ytans，dict；and he was fo affected with gricf at her ciath，that he hardly cuer recovered it，but was obferved from that time to become lefs active， more melancholy，and，if that could be，more cynical than ever．At the fame time，a clancery fuit in which he was concerned with Sir Joln Cutler，on account of his falary for reading the Cutlerian lectureb，made him very uneafy，and increafed his diforder．In 16g：， he was employed in forming the plan of the hofpital near Hoxton，founded by Robert Ak alderman of London，who appointed arclibihop Tillotion one of his executors；and in December the fame year．Hooke was created doctor of plyfic，by a warrant from that
prelate. In July $16 y 6$, the chancery fuit with Sir John Cutler was determined in his favour, to his incxpreffible fatisfaction. His juy on that eceation was found ia his diary thus exprefted; domshlgissa: that is, D.o, Opimo, Maxino, fit honor, laus, glaris, in fecula ficuloram, Amen. "I was born on this day of fuly 1035, and God hath given me a new birth : may I never forget his mercies to me! white he gives me breath may 1 praife him!"-1n the fame year righ, an order was granted to him for repeating mot of his experiments at the expence of the Royal Socicty, upos a promife of his finihing the accounts, oblervations, and deductions from them, and of perfecting the defeription of all the infruments contrived by him; but his increafing illucfs end general decay rendered him unable to performit. He continued fome years in this wafting condition; and thus languifhing till he was quite emaciated, he died March 34, 1702 , at his lodgings in Greflam college, and twas buried in St Helen's church, Bihoprgate ftreet; his eorpfe beine attended by all the nembers of the Royal Society the in in London.-As to Mr Hooke's chatacter, it is not in all refpects one of the moft amiable. He muade but a defpicable figure as to his perfon, being thort of tlature, very crooked, pale, lean, and of a meagre afpect, with dark browe hair, very long, and hanging uver his face uneut and lank. Suitable to his perfon, his temper was penurious, melancholy, miftrullful: and, inough poffefled of great philofophical knowledge, he had fo much ambition, that he would be thought the only man who eould invent or difcover; and thus frequently laid claim to the inventions and difeoveries of others, while he boatted of many of his own which he never communicated. In the religious part of his charafer he was fo far exemplary, that he always expreffeit a great veneration for the Deity; and feldom jeceived ary remarkable bonefit in life, or made any confideratle difcovery in nature, or invented any ufefial contrisance, or found out any dificult problem, without fotting down his acknowledgment to God, as many places in his diary plainly how. He frequently thudied the facred writings in the original; for he was acquainted with the ancient languages, as well as with all parts of the mathematics.-He wrote, I. Lectiones Cutteriane, 2. Micergraphia, or Deferiptions of minute bodics made t-y maguifying glafes. 3. A defcription of heliofcopes. 4. A defeription of fome mechanical improvements of lamps and water-poifes, quarto. 5. Philofophical eollections. After his death were publinhed, 6. l'oll humous work collected from his papers by Richard Watler fecretary to the Royal Society.

HOOKE (Nathanicl), author of an efteemed Roman hiftory and other perfnrmances. Of this learned Fentleman the ealiell particulars to be met with are furnifhed by himifelf, in the following modeft but manly addrefs to the Earl of Oxford, dated OEF. 7. 1722: "My Lorl, the firlt time I had the honour to wait upon your lordhip fince your coming to London, your lordhip had the goodneff to ank me, what way of life I was then engaged in; a certain mauvaife honic hindered me at that time from giving a direct anfwer. The truth is, my lord, 1 cannot be faid at prefent to be in any form of life, but rather to live extempore. The late epidemical diftenper feized me,

I endeavouted to be rich, imagined for a while that I was, and am in fome meafure happy to find myfelf at this intant but juft worth nothing. If your lordhip, or any of your numeron; triends, have need of a fervant, with the bare qualifations of being able to tead and write, and to be honet, 1 thall gladly undentake any employments your lordhip frall wot think me unworthy of. I have been taught, my lord, that neither a man's natural pride, nor his felf-love, is an cqual judge of what is fit for him ; and I thall endeavour to remember, that it is not the thort part we act, but the manuer of our performanee, which gaias or lofes us the applaufe of Him who is finally to deeide of all buman actions. My lord, I am juit now employed in tranflating from the French, a Hiflory of the Life of the late archbihhop of Cambray; and I was thinking to beg the honour of your lordhip's name to protect a work which will have fo mucli need of it. The original is not yet publimed. 'Tis written by the author of the 'Difconrfe upon Epic Poetry,' in the new edition of Tclumaque. As there are fome paflages in the book of a particular nature, I dare not folicit your lordhip to grant me the favour I have mentioned, till you firt have pernied it. The whole is fhort, and pretty fairly tranicribed. If your lordmip could find a fpare hour to look it over, I would wait upon your lordhip with it, as it may poffibly be no unplealing entertainment. I hould humb'y afk your lordhip's pardon for folong an addrefs in a feafon of fo much bufinefs. But when fhould I be able to find a time in which your lordhip's goodnefs is not employed? I am, with perfect refpect and duty, my lord, your lordhhip's moft obliged, molt faithful, and molt obedient humble fervant, Nathaniel Hooke." The tranfation here fpoken of was afterwards printed in $12 \mathrm{mo}, 1723$. From this period till his death, Mr Hooke enjoyed the confidence and patronage of men not lefs dithinguihed by virtue than by titles. In $17 \ldots$ he publified a tranilation of Ramfay's Travels of Cyrus, in 410 ; in 1733 he revifed a tranfation of "The Hiltory of the Conqueft of Mexico by the Spaniards, by Ihomas Townfend, Efq;" printed in 2 vols 8 vo; and ia the fame year he publifhed, in to, the firtt volume of "The Roman Hillory, from the building of Rome to the ruin of the Commonwealth; illullrated with maps and other plates." In the dedication to this volume, Mr Hooke took the bpportunity of " publicly tellifying his juft efteem for a worthy friend, to whom be had been long and much obliged," by telling Mr Pope, tiat the difplaying of his name at the head of thofe fleets was "like the hanging out a fplendid lign, to catch the traveller's eye, and entice him to make trial of the entertainment the place alfords. But," he proceeds, " when I ean write under my lign, that Mr Pope has been here, and was content, who will quedtion the goodnefs of the houfe?" The volume is introduced by" Remarks on the Hiltory of the Seven Roman Kings, occafioned by Sir Ifaac Newton's objections to the fuppofed $2+4$ ycars d!yation of the royal llate of Rome." His nervous pen was next employed in digeiling "An Account of the conduct of the Dowager-duchefs of Marlborough, from her firt coming to Court to the year 1710, in a Letter from berfelf to Lord -.. in 1742 ." 8wo. His reward on

er. this oceafion was confiderable; and the reputation he aequired by the performance much greater. The circumllances of this tranfaction are thus related by Dr Maty, in his Memoires of Lord Cheftrtield, vol. i. p. 116. "The relict of the great duke of Marlburough, being defircus of fubmitting to pofterity her political conduet, as well as ter lord's, applied to the earl of Chesestield for a proper perfon to receive her information, and put the menvire of her life into a proper defo. Mr Houke was recommended by him for that purpofe. He actordingly waited upon the dechers, white the was thill in hed, opprefted by the infrmites of age. But, knowing who he was, the immediately got herfelf lifted up, and centinued Speaking during fix hours. She delivered to lim, without any notes, her account, in the molt lively as well as the molt connected manner. As fhe was not tired herfelf, the would lave continued longer the bulinef; of this firf fitting, had not the perceived that Mr Hroke uas quite exhaulled, and wanted refrefment as well as relt. So eager was the for the completion of the work, that fhe inlilled uporn Mr Hooke's not leaving her houfe till he had finithed it. This was done in a fhort time ; and her Grace was for well pleafed with the performance, that the complimented the author with a prefunt of 50001 . a fum which far exceeded his expectations. As foon as he was free, and permitecd to quit the houfe of his benefactrefs, he battened to the earl, to thank him for his favour, and communicated to him his good fortune. The perturbation of mind he was under, occafioned by the Atrong fenfe of his obligation, plaialy appeared in his flammering out his acknowledyments: and he, who had fucceeded fo well as the interpteter of her Grace's fentiments, could fearecly utter his own." The fecond volume of his Roman billory appeared in 1745 ; when Mr Hooke embraced the fair occafion of congratulating his worthy friend the earl of Marchnont, on "that true glory, the conlenting praife of the honelt and the wife," which his lordthip had fo early acquired. 'To the fecond volume Mr Hooke added "The Capitolite Marbles, or Coniular Caltidars, an ancient Monument accidentally difcovered at Rome in the year 1545, dilring the Pontificate of Paul IIL." In $175^{8} \mathrm{Mr}$ Hooke publihed "Obfervations on, 1. The Anfiver of M. l'Abhe de Vertot to the late carl of Stanhope's $\ln$ quiry concerning the Senate of ancient Rome: dated December, 1719. 11. A Differtation upon the Conllitution of the Roman Senate, by a Gentleman : publifhed in 1743. IIl. A Treatife on the Roman Senate, by Dr Conyers Middleton : publihed in 1747. IV. An Efray on the Roman Senate, by Dr Thomas Cbapman : publithed in 1750;" which he with great propricty inferibed to Mr Speaker Onflow. The third volume of Mr Hooke's Roman Hillory, to the end of the Gallic war, was printed under his infpection before bis lalt illnefs; but did not appear till after his death, which happened in 1764 . The fourth and lant volume was publifind in 1771. Mr Hooke left two fons; of whom one is a divine of the church of Eng. land; the other, a doctor of the Sorbonne, and profeffor of aftronomy in that illulltrious feminary.

HOOKER (John), alias Vowisle, was bornin Exeter, about the year 1524, the lecond fon of Robert Hooker, who in 1529 was reayor oi that city.

He was indrueked in grammar learning by Dr More. Hookero man, vicar of Menlinit in Cornwal, and thence removed to Oxford; but to what college is uncertain. Having left the uni, crlity, he travelled to Germany, and relided fome tine at Colugue, where be kept ex. creifes in law, and probably graduates. Thence he went to Strafburg, where he lludied divinity under the famous Peter Martyr. He now returned to Eng. land, and foon after viited France, intendilig to pracoed to Spain and Italy; but was provented by a declaration of war. Returning therelore again to England, he lixed his relidesee in his native city, where, having inarifed, loe was in 1554 elected chamberlain, being the lint perfon who held that oflice, and in 1571 reprefuted his fellow-citizens in partiament. H, died in the year 1601, and was buried in the cathedral church at Dixeter. He wrote, anong othes works, 1. Order and ufage of keeping of paliaments in lreland. 2. The events of comets or blazing flars, made upon the fight of the const Pagonia, which appeared in November and December 1577. 3. Au addition to the chronicles of Ircland foom $15+6$ to 1568 ; in the fecond volume of Holinhed's chronicls. 4. A defcription of the city of Exeter, and of thefondrie affaults given to the fame; Holinht chron. vol. iii. 5. A book of enfigns. 6. Tranflation of the liftory of the conqueft of lreland from the Latin of Giraidus Cambrenfis; in Holinfh. cloron. vol. ii. 7. Symopfis chorographita, or an hilforical record of the province of Devon; never printed.

Hooker (Richard), a leanned divine, was bern at Heavy-tree, near Exeter, in the year 1553. Some of his ancellors were mayors of that city, and he was nephew to Oobn Hoosgr the hiltorian. By this uncle he was firlt fupported at the univerfity of Oxford, with the addition of a fmall penfion from 1)r Jewel, bithop of S lifloury, who in 1561 got him admitted one of the cherks of Curpus. Ctrifti college. In 1573 he was clected (cholar. In 1577 he trok the degrec of malter of arts, and was admitued fellow the fane year. In Joly 1579 , he was appointed deputy profeflor of the Hebrew languageIn October, in the fame year, he was for fome trivial mifdemeanor expelled the college, bur was immediately rellored. In 158: he took orders; and, being appointed to preach at St Paul's crofs, he came to London, where he was unfortunately drawn into a marriage with Joan Churchman, the termagant daugher of his hoftefs. Having thus lof his fellowhip, he continued in the utmolt diftrefs till the year $15^{8}$, when he was prefented by John Cheny, Efq; to the rectury of 1)ray-ton-Beaucham in Buckinghamhire. In this retirement be was vifited by Mr Edwin Sandys, and Mr George Cranmer, tis former pupils. They found him, with a Horace in his hand, tending fome theep in the common field, Lis fervant having been ordered home by his fweet Xantippe. They attended bim :o his houfe; but were foon deprived of his company by an order from his wife Joan, for him to come and rock the crachle. Mr Sandys's reprefentation to his father, of his tutor's fituation, procured him the mafterfhip of the Temple. In this fituation he met with confiderable moleflation from one T:avers, lecsurer of the Temple, and a biguted Puritan, who in the afternoon endeavoured to confute the dnetrine livered in the morning. lrom this difagrecable fitua.
isomer, tion he ivhicited arehbillop Whitgith to remove him to fome country retirencot, where he might profecute his fudics in tranguillity. Accordingly, in 1591 , he
ob:ained the rectory of Bofcomb in Wilefhire, together with a prebend in the church of Salifury, of which he was alfo made fu'dean. In $159+$ he was prefented to the rectory of Bihopfoourne in Kent, where he died in the year 1600 . He was buriet in his own parifi-elurch where a monument was ereet. ed to his memory by Witlian Cooper, Efq. He was a meth pious, and lamed divine. He wrote, i. Ecclefinaical politie, in cight books, fol. 2. A difcourfe of jullification, E.c. with two other fermons, Oxford 1512, 4to. Alfo feverd other fermons printed with the Ecceffiatical Politie.
Hoorer, in naval archiceture, a veffel much ufed by the Dutch, built like a pink, but rigged and mafted like a hoy.-Hookers will lie nearer a wind than vef. fels with crofs-fails can do. They are from 50 to 200 tons burden, and with a few hands will fail to the Eaft Indies.

HOOP, a piece of pliant wood, or iron, bent into a circular form, commonly ufd for fecuring calks, isc.

Driving a Hoop a bayin excreife, of good effect in rendering the limbs piliable, and for frengthening the nerves.

HOOPER (John), bihop of Worcefter, and a maregr in the Proteltant caufe, was born in Somerfetmire, and educated at Osford, probably in Mertoncollege. In $15: 5$ he took the degree of bachelor of arts, and aftersards becane a Cittereian monk; but at length, diniking bis fratemity, he returned to Oxford, and there became infected with Lutheranifm. In 539 he was made chaplain and houfe-lleward to Sir John Arundel, who afterwards fuffered with the protector in the reign of Edward VI. But that very a. tholic knight, as Wood calls him, difcovering his chaphain to be a heretic, Hooper was obliged to leave the kingdum. After continuing fome time in France, he returaed to Enztand, and lieed with a gentleman called Scintlou: but being again difeovered, he efcaped in the habit of a falior to lretand; thence embark. ed for the continent, and fixed his abode in Switzerland. -Whanking Edward eame to the crown, Mr Honper retisned once more to his native counsry. In 1550 , by lis old patron Sir John Arundel's interelt with the eanl of Warwick, he was confecrated bithop of Gloucefter; and in 1552 was nominated to the fee of Woreefter, which he held in commondan, with the former. But queen Mary had fcarce afcended the throne, before his lordhip was imprifoned, tried, and, not choofing to reeant, condemned to the flames. He fuffered this terrible death at Gloucefter, on the gth of February 1554 , being then near 60 years of age. He was an avowed enemy to the church of Rome, and not perfectly reconciled to what he thought rem. nants of Popery in the church of England. In the former reign he had been one of Bonner's accufers, which fufficientlv accounts for his being one of queen Mary's firlt facrifices to the holy fee. He was a perfon of goor? parts and learning, as may be found in Fos's Book of Marters.

Honpre (Gcorge). a very learned writer, bifhop of Bath and Wells, was well Rilled in mathematics, and N $^{\circ} 157$.
in the eaftern learning and languares. We fat in thofe fees above $z_{i}$ years, often refufed a feat in the privy council, and could not be prevailed upon to accept of the bilhopric of London on the death of bifhop Comp. ton. He wrote, r. The church of England free from the imputation of Popery. 2. A difcourfe concerning Lent. 3. New danger of Preflytery. 4. An inquiry into the itate of the ancient meafures. 3. De l'alentivianorunt bercticonjecturx. G. Several fermons; and other works.

HOOKNBECK (John), profeffor of divinity in the univerfities of Leyden and Utrecht, was born at Haerlen in 1617. He underllood the Latin, Hebrew, Chaldaic, Syriac, Rabbinical, Dutch, German, Englifh, French, and Italian languages; and publifhed many works, among which are, 1. A refutation of Socinianifm, in 3 vols $\not$ to. 2. A treatife for the convistion of the Jews 3. Of the converfion of the Heathens. 4. Theologics! inftitutions, \&c. which are written in Latir. Mr Bayle reprefents him as a complete model of a yood paltor and divinity profeffor.

HOP, in botany. See Hunulus.
Hops were firf brought into England from the Netherlands in the year 1524. They are lirft mentioned in the Englin ftatute-book in the year 1552, viz. in the 5 and 6 of Edw. VI. cap. 5. And by an aet of parliament of the firt year of king James I. anno 1603. cap :8. it appears, that hops were then produced in ahundance in Eugland.

The hop being a plant of great importance in the article of brewing, we fhall confider what relates to the culture and mangement of it, under the following heads:

Of Soil. As for the choice of their hop grounds, they efteem the richelt and frongelt gromens the moft proper ; and if it be rocky wichin two or three feet of the furface the hops will profper well ; but they will by no means thrive on a fiff clay or fpongy wet lans.

The Kentifl planters account new land beft for hops; they plant their hop gardens with apple trees at a large diftance, and with cherry-trees between; and when the land hath done its beft for hops, which they reckon it will in about 10 years, the trees may begin to bear. The cherry trees lalt about 30 years, and by that time the apple-trees are large, they cut down the cherry trees.
The Effex planters account a moory land the mon proper for hops.

As to the lituation of a hop-ground, one that inclines to the fouth or weft is the moffigible: but if it be expofed to the northealt or fonthwef winds, there fhould be a fheler of fome trees at a diflance, becaure the northeaft winds are apt to nip the tender fhoots in the fpring; and the fouthwefl winds frequently break and blow down the poles at the latter end of the fummer, and very much endanger the hops

In the winter-time provide your foil and manure for the hop-ground againt the following fpring.

If the dung be rotten, mix it with two or three parts of common earth, and let it incorporate together till
you have occalion to make ufe of it in making your hop hills; but if it be uew dung. then $k t$ it be mixad as before till the fpring in the next year, for new dung is very injurious to hops.

Dung of all forts was formerly more commonly made ufe of than it is now, efpecially when rotted and turned to mond, and they who have no other manure mult ule it ; which if they do, cows or hogs dung, or human ordure mixed with unid, nay be a proper compolt, becaufe hops delight molt in a manure that is cool and moilt.

Planting. Hops require to be planted in a fituation foopen, as that the air may frecly pafs round and hetween them, to dry up and difipate the moiture, wher by they will not be fo fubject to fire blath, whieh often de itroy the middes of large plantations, while the outhees temain unhart.

As for the preparation of the greund for plating, it Thould, in the preeding winter, be plowed and harrowed eron: and then lay upon it in heaps a good quantity of freh rich carih, or well rotted dung and eath mixed to pether, fufficient to put half a buthed in every hole to plant the liops in, unkefs the natural ground be very freth and good.

The hills where the hops are to be planted hould be eight or nine fert afunder, that the air may fiece', pafs between them; for in clofe plantations, they are very fubject to what the hop-planters call the fiec llog?

If the ground is inten +d to be ploughed with hortio botween the hills, it will be belt to plant them in fquars cheequersife; hat if the ground is io fmall that it be may done with the brealt-phugh or Ppade, the holes thould be ranged in a quineurx form. Which way foever you make ufe of, a dake hould be theo's down at all the places where the hills are to be taade.

Perfons outhe to be very curious in the chose of the plants as to the kind of hop; for if the hop garden be planted with a maxture of feveral forts of hops that ripen at leveral times, it will caute a great deal of trouble, and be a great detriment to the owner.

The two bell forte are the white and the grey hind; the latter is a large fquare hop, more haidy, and is the more plentiful beater, ans ripas later than the Former.

There is alfo another fort of the white bind, whith ripens a weck or ten days before the comman, hut this is tenderer, and alefs plentifal beaser; bat it has this advantage, that it comes fill to market.

But if three grounds, or three dutant parts of one grounl, be planted with thete three forts, :here will be this convenieney, that they may be picked fuccef. favely as they become ripe. 'lhe fets thonld be five or fix inches long, with three or more juints or bide on the en.

If there be a fort of hop you value, an a would ia creale plants and fets from, the fuputuous binds may be laid down when the hops are tical, entring off the tope, and burying them in the hill; on when the hops are deffed, all the curtings may be faved; for alnot every part will grow, and becerree a good fet the next Ipring.

As to the feafons of planting hops, the Kentin planeers belt approve the months of Oetbor abul Marth, buth which [onatimes in eces very wel; but the fits are not to be had in Ottuber, wilefs from

Vob. VIII. Pattil.
fore ground that is to be deltroyed; and likewife there is fome danger that the fets may be lotted, if the win. ter prove vely wet; therefore the moll ufiral time of procuring them is in March, when the hops are cut and dreffed.

As to the manner of planting the fete, there houkl be live good fats planted in every l:ill, ore in the middle, and the relt round about lloping, the tops mecting at the ecntre; they mut thand even whet the furface of the ground: ket them be preffed clofe with the hand, and covered with fine earth, and a Alick fhould be placed on each fide the hill to focure it.

The ground being thus planted, all that is to be done more duriug that fummer, is to keep the hills clat from weeds, and to diry up the ground about the month of May, and to raife a fmall hill round about the plants. In Junc you muat twit the goung bind or branches togethen intos a bunch or knot; for if they are tied up tos foall peles the tirtt year, in order to have a few hops form them, it will not cunntervall the weakening of the plants.

A mixture of compolt or dung beirg prepared for your hop ground, the bett tire for laying it on, if the weather prove dry, is ahout Michachmas, that the wheels of the dung cart may not injure the hops, nor furems. the ground: if this be not done then, you muit be obliged to wait till the Erolt bas hardened the groun, fo as to bear the dung eart; and this is allu the time to carry on gun new pules, to recruit thofe that are decayed, and to be caft out every year.

It you have good itore of clung, the beit way will be to fpreal it in the alleys all over the ground, and wadis it in the winter following. The yrantity they will rquire will be to lowds to an acre, reckoning about 30 tuinels to the luad.

If you have not dung enough to cover all the ground in one year, you may lay it on one pa.t one year, ami on the rett in anothet, or a third; for there is no ocea. lion to dung the ground after this ianamer oftener than once in threc ycars.

Thure who have bat a fonall quantity of dung, ufually content themfelves with laying on about tweniy loads upon an acre crory year; this they lay only on the hills, cither about Nisember, or in the fpring ; which lat fome accoment the but time, when the bops are drefled, to cover them after ticy are cut ; but if it be done at this time, lace compol or dung onglat to be very well rotted and fine.

Draling As to the drefling of the hops, when the hopeground is cony in funuary or February, the carth about the hults, and very near them, onght to be taken awy with a fparke, that you may corse the more cunveniently at the tock to cut it.

About the end of Febraary, if the hops were planted the Fraing before, or if the ground be weak, they onght to be drefled in dry weather; bue elle, if the gromus bs itrong and in pertection, the middle of March will be a good time; and the liter end of Murch, if it lee apt to produce over-rank bind, or the teginaing of dpril may be foon enough.
'loun having with an iron pickor cleared away all the earth out of the hills, fo as tus elear the tock to the principal roots, with a harp knife you mult cut off alt the thoot, which grew up with the binds the iat year; and alfo ull the young luckers, that none be left to tun 4 M

Hops. in the alley, and weaken the hill. It will be proper to cut one part of the flock lower than the other, and alo to cont that part low that was left highert the preceding year. By purfuing this method you may expect to have ltrougre buds, and alfo keep the hill in good order.
ladreffing thofe hops that have been planted the year before, yon ouglit to cut off both the dead tups and the young fuckers which lave fprung up from the fets, and afor co cover the Hocks with fine carth a finger's length ia thicknefs.

The poling. About the middle of April the hops are to be poled, when the thoots begin to fprout up; the poles muit be fet to the hills decp intu the gromnd, with a fquare iron picker or crow, that they may the better endure the winds; three poles are fufficient for one hill. Thefe thould be placed as near the hill as may be, with the ir bending tops turned outwards from the hill, io prevent the binds from entangling; and a fpace between two poles ought to be left open to the fouth to admit the fun-beams.

The poles ought to be in length 16 or 20 feet, more or lefs according as the ground is in Arength; and great care mult be taken not to overpole a young or weak gronnd, for that will draw the lock too much, and weakca it. If a ground be overpoled, you are not to expect a good crop from it ; for the branches which bear the hops will grow very litte till the binds have over-reached the poles, which they cannot do when the puls are too long. Two fmall poles are fufficient for a ground that is young.

If you wait till the firouts or young binds are grown to the length of a foot, you will te able to make a better judgment where to ylace the largelt poles; bur if you ftay thll they are fo long as to fall into the alleys, it will be injurious to them, becaufe they will entangle one with anuther, and will not clafp about the pole seadily.

Maple or afpen poles are accounted the beft for hops, on which they are thought to profper beil, becoufe of the ir warmth; or elfe, becaufe the climbing of the hop is promoted by means of the roughnefs of the Bark. But fur durability, athen or willow poles are preferable; but chefaut poles are the mott durable of all.

If after the hops are grown up you find any of them have been under-poled, taller poles may be plaeed near thofe that are too thort to receive the binds from them.

The tying. As to the tying of hops, the buds that do nut clafp of themfelves to the nearell pole when they are grown to thice or four feat bigh, mult be guided to it by the land, turning them to the fun, whofe coure hey will always follow. They mult be Lound with withered rufhes, but not fo clofe as to hinder them from climbing up the pole.

This you muft continue to do till all the poles ate furnilhed with binds, of which two or three are enough for a pole ; and all the fprouts and binds that you have sou occafion for, are to be plueked up; but if the ground be young, then none of thefe ufelefs binds fhuold be phacked up, but fhould be wrapt up together in the midulte of the hill.

When the binds are grown beyond the reach of your bands, if they forfake the poles, you fhould mate we of a Atand lader in tying then ug.
'Towards the latter end of May, when you have made an end of tyirg them, the ground muth have the fummer dreflug: this is done by calling up with the foale fome tine earth into every hill ; and a month after this is donc, you mut hoe the alleys with a Duteh hoe, and make the hills up to a convenicut bignefs.

Gathering. About the midlle of July hops begin to blow, and will be ready to grather ahout Bar:holomew Tide. A judgnent may be made of their ripenefs by their ltrong feent, their harduefs, and the brownith colour of their feed.

When by thefe tokens they appear to be ripe, they mult be picked with all the expedition pollible; for if at this time a ftorm of wind fhould come, it would do them great damage by breaking the branches, and bruifing and difcolouring the hops; and it is very well known that hops, being picked green and bright, will fell for a third part more than thofe which are difooloured and brown.

The moll convonient way of picking them is into a long fquare frame of wood, called a lin, with a cluth hanging on tenter-hooks within it, to receive the hops as they are picked.

The frame is compoied of four pieces of wood joined togerther, fupported by four lefs, with a prop at each end to bear up another long piece of wood, placed at a convenient height over the iniddle of the bin; this ferves to lay the poles upon which are to be picked.

This bin is commonly eight feet long, and thrce feet broal; two poles may be laid on it at a time, and fix or eight perfons may work at it, three or four on cach tide.

It will be bet to begirs to pick the hops on the eat or noth lide of your ground, if you can do it convemiently; this will prevent the fouth well wind from brealiug into the garden.

Having made choice of a plot of the ground containiug is hills fquare, place the bin upon the hiils which is in the centre, having five hills on each fide; and when thefe hills are picked, remore the bin intw another piece of groms of the fame extent, and fo proceed thl the whole hop ground is finimad.

When the poles ate drawn up to be picked, yous mult take great care not to cut the binds tos near the hills, efpecially when the hops are green, becaufe will make the fap to flow exceflively.

The hops mult be picked very clean, i. e. free from leaves and lalks; and, as there hall lee occafion, two or chree times in a day the bin nuat be emptied intu a hop lage made of conrfe linen cloth, and carried immediately to the oatt or kila in order to be dried; for if they thould be long in the bin or bag, they will be apt to heat and be difeolvured.

If the weather be hot, there fhould no more poles be drawn than can be picked in an hour, and they fhould be gaticered in fair weather, if it can be, and when the hops are diy; this will fave forne expence in firint:, and peferve their colour better when they are dric!.

The erop of hops heing thus betowed, you are to take care of the polts againl another year, which are bet to be laid up in a lhect, having firt ftripped off the haula from thead ; but if you have not that conveniExC2
ency, fet up three poles in the form of a triangle, or fix poles (as you pleafe) wide at bottom; and having fet them into the ground, with in iron picker, and bound them together at the top, fot the retl of your poles about them; and being thus difpofed, none but thofe on the outfide will be fubject to the injuries of the weather, for all the inner poles will be kept dry, unlefs at the top; whereas, if they were on the ground, they would receive more damage in a fortnight than by their flanding all the reft of the year.

Drying. The beft method of drying hops is with charcoal on an oaft or kiln, covered with lazir-cloch, of the fame form and fafion that is ufed for drying malt. There is no need to give any particular directions for making thefe, fince every carpenter or bricklayer in thofe countries where hops grox, or malt is made, knows how to build them.

The kiln ought to be fquare, and may be of 10,12 , 14, or 16 feet over at the top, where the bops are laid, as your plantation requites, and your room will allow. Thice ought to be a due proportion between the height and breadth of the kiln and the beguels of the fleedle where the fire is kept, riz. if the kiln be 12 feet fquare on the top, it ought to be nine feet liigh from the fire, and the flecdle ought to be fix feet and a half fquare, and fo proportionable in other dimenfions.

The hops mull be fipread even upon the call a foot thick or more, if the depth of the cusb will allow it; but care is to be taken not to overload the calt if the heps be green or wet.

The oall ought to be firl warmed with a fire before the hops are laid on, and then an even fteady fire mutt be kept unicr them; it mull not be too fierce at firft, 1eft it feorch the hops, nor muft it be fuffered to fink or flacken, bet rather be increafed till the hops be nearly dried, left the moillure or fweat which the fire has raifed fall back or difcolonr them. When they have lain about nime hours they munt be turned, and in two or threce hours more they mary be taken off the oaft. It may be known when they are well dried by the britulenets of the ftalks and the eafy falling off of the bop leaves.

It is found by experience that the turning of hops, though it be after the molt eafy and beft manner, is not orly an injury or watle to the hops, but alfo an expence of fuel and time, becaufe they reguire as much fuel and as long a time to dry a fmall quantity, by turning them, as a large one. Now this may be prevented by having a cover (to be let down and raifed at pleafure) to the upper bed whereon the hops lie. This cover may alfo be tinned, by mailing fingle tin plates over the face of it; fo that when the hops begin to diy, and are ready to burn, i.e. when the greatell part of their meiflure is evaporated, then the cover may be let down within a foot or lefs of the hops (like a reverberatory), which will refect the heat upon them, So that the icp will foon be as diy as the lowermoll, and every hop be equally dried.

Eagging. As foot as the lirps are taken of the kiln, lay them in a room for three weeks or a nonth to crol, give, and toughen ; for if they are bag. ged inmediately they will powder, but if thcy lie a white (and the longer they lie the better, provided they be covered clofe with blankets to fecure them from the
air) they nay be basged with nore fafe: $\because$, , 23 not being liable to be broken to powder in treading; aad this will make them bear treading the betier, and the harder they are trodden the better they will keep.

The common method of bagging is as follows: they have a bole made in an upper floor, either round or fquare, large enough to receive a hop-bag, which confifte of four ells and a half of ell-wide cloth, and allin contains ordinarily two hundred and a half of hops; they tie a handful of hops in each lower corner of the bag. to ferve as liandles to it; and they fallon the mouth of the bag, fo placed that the hoop may ref upon the edges of the hole.
'Then he that is to tread the hops down into the hag, treads the hops on every fide, another perfon continually putting them in as he treads them till the bag is full; which heing well filled and trodden, they unrip the fattening of the bag to the hoops, and let it down, and clofe up the month of the bag, tying up a handful of hops in each corner of the mouth, as was done in the lower part.

Hops being thus packed, if they have been well óried, and laid up in a dry place, will keen good feveral years; but care muft be taken that they be neither deltroyed nor foiled by the mice making their neits in them.

I'roduce. The charge of an acre of hop-ground in moft parts of England where hops are cultivated, is computed thus: three pounds for the nuleandry, four pounds for the wear of the poies, five pounds for picking and drying, one pound ten thillings for dung, one pound for rent, though in fome places they pay four or five pounds an acre yeatly for the rent of the land, and ten fhillings for tythe; in all L 15 a year. The hopplanters in England reckon thet they have but a moderate return, when the produce of an acre of hope coes not fell for more :han L..jo. They frequenty have fifty, fixty, cighty, or a hundred pounds; and in a time of gencral fearcity confiderably more: fo that, upon the whole, if the total charge of an acre of hops is computed at fifteen pounds a year, and its average produce at thirty pounds, the clear profit from an acre will be fifteen pounds a year. But the plantation of hops has lately fo much increafed, and the average produce fo much exceedd the confumption, that hop; have been wih many planters rather a leling than a very profitable article.

U/fo. In the furing.time, while the bud is yet tencer, the tops of the plant being cut off, and boiled, are ate like afparagus, and found very wholefome, and effectual to lonfen the body; the heads and tendrils are good to purify the hlood in the feary, and molt cutaneous difeafes; decoctions of the flowers, and fyrups thercof, are of ufe againft pettilential fevers; juleps and apozems are alfo prepared with hopa for hypochondriacal and hyterical afte: Rions, and to promote the menfes.

A pillow fluficd with hopa and lail ander the head. is laid to procure fleep in fevers attended with a delirium. But the principal ufe of hops is in the breweis for the prefersation of malt liquors: which by the fuperaddition of his balfamic, aperient, and diuretic bitter, bccome lefs vifeid, lefs apt to turn four, more Cetergent, more difpofed to pafs off by urine, and in general more falubrious. They are faid to contain an

Inps, agreeable odntiferous principe, which fromotes the wi in watm water, they increate its fariturnes.

Iaters reatiny th llops. Dy 9 Aare, cap. 121. an additional duty of 3 d a pound is laid un all hops imported, orer and above all other duties; and hops landed before entiy and payment of duty or without warrant for landing, thall be forfeited and burnt : the Ghip alf, thall be fonfeited, and the perfon concerned in importing on landing fhall forfeit 51 . a homdred weight. 7 Geo. 11. cap. 19. 135 9 Anne, cap. 12. thete Mat! be paid a duty of id fur cuery pound of hops grown in Great Britain, and made fit for ufe, within fix months after they are cured and bagged; and hop. grounds are required to be entered on pain of 40s. an acre. Places of curing and kceping are alfo to be en. tered, on pain of sol. which may be vifited by an cfficer at any time without obluction, sonder the penalty of 201 . All hops thall, within tix weeks after gathering, be brought to fuch places to be cured and bagged, (n pain of 5 s. a pound. The rebagging of foreign hops in Britith bagging for fale or exportation, incurs a forfeiture of 10 . a hunded weight; and defrauding the king of his duty by ufing twice or oftener the fame has, with the officer's mark upon it, is liable to a penaliy of +0 . The removal of hops before they have been bagged and weighed, incurs a penalyy of 51 . Concealment of hops fuljects to the frrfeiture of 201. and the conceald hops ; and any perfon who fhall privately convey away any hops, with intent to defraud the king and owner, mall forfeit 5 s. a pound. And the duties are required to be paid within fix months after cuing, bagging, and weighins, on pain of double duty, two thirds to the king, and une-third to the informer. No common brewer, \&c. Thall ufe any bitter ingredient in!tead of hops, on pain of 201 . Heps which have paid the duty may be exported to lretand; but by 6 Geo. II. cap. 11. there fhill be no drawback; and by 7 Geo. II cap. 19. no foreign hops fhall be landed in Ireland. Notice of bagging and weighing thall be fent in writing to the officer, on pain of 501 . 6 Geo. cap. 21. And by 14 Geo. III. cap. 68. the officer thall, on pain of 51 . weigh the bags or pockets, and mark on them the true weight or tare, the planter's name, and place of abode, and the date of the year in which fuch hops were grown; and the altering or foging, or obliterating fich mark, incurs a forfeiture of 101 . - The owners of hops thall keep at thein oafts, \&c. juft weights and fake, and permit the offeer to ufe them on pain of 201. 6 Gee. cap. 2I. And by 10 Geo. III. cap. 44. a penalty of $\mathrm{t}=01$. is inflicted for falfe fcales and weights. The owners are allowed to ufe cafks inftead of bags, under the fame regulations. 6 Geo. cap. 21. If any perfon thall mix with hops any drug to alter the colour or feent, he hall forfeit 5l. a handicd weight. If any perfon thall unlawfully and malicioully cut hop binds growing on poles in any phantation, he flall be gruilty of felony without benctit ef clergy. 6 Geo. Il cap. 37 . By a late a A , five f.r cint. is added th the duties on hops.

HOPE (I)r John), profeffor of botany in the univerfity of Edinturgh, was born at Ediuburgh on the Lotls of May 1725 . He was the fon of Mr Robert Hope a relpeetable furgeon, whofe father, Loid Ran-

tors of the college of juftie in the hing dom of Seot. fond. By his mother he was defeendes from the an. ciont fanty of Glafs of Sanchie in Stirtingthere After thining the ufand courfe of fchool education, he cntered to the univorhty of Edinburgh; and laving, as it were, an hereditary predilection for the heahing art, his attention wats foon particularly directed to that branch of feicnce. Having pinifted his academical education at Edinburgh, he vifted other medical fihools; and upon his retusn to his native country, he obtaned the degree of Doetor of Madicine from the univerity of Glafoow in the becrinuing of the yedr 1750. A few month, alter that, he was almitted a member of the ryal college of phyfoians in Edin. butgh, and entered upon the praxice of medicine in this city. After be had continued about ten years in practice, difcharging the daties of his profeffion with a d.gree of judginent, aitenion, and humanity, which did him great honour; by the death of Dr Alfton the botanical char in the univerfity became vacant ; when Dr H pre, by a commition from his fovereign, dated the $13^{\text {th }}$ of April $17^{5}$, was appoiatel king's butanit for Scothn\} and fuperintendant of the rogal garden at Edin'uesh. A tew weeks after this he was clectrd by the town council of Edinburgh as the facceflor of Dr Alton in the profeflorthips buth of botany and materia medica; and thus be beame one of the members of the facul $y$ of medicise in the univerfoty. After he had contioned for about dis years to give regular courles of lectures on thefe faheects, with no lefs credit to himfelf tham benefit to his hearers, teaching the one branch dining the fummer, a d the other during the winter months, he found chat his lealth was cuafierably i:npaired; which induced him to form the refolution of refgening the materia medica, and of afeenare foldy conhning his labours as a teacher to his fivourice feience of botany. This refolution he carted into offeet in the year $1768^{\text {; }}$ and by a new comminom from his maj:lly, dated the Sch of Miy, he was numinated regius profeffor of medicine and butany in the univalaty, and had the offies of king's botanit an! fuperintendant of the royal garden confered upon him for hife, which till that time had been al says granted during pliafure only.

Dr Hope's predeceflor, alchourh a learned and worthy man, could never obrain fuffecent publie fuads for the eftablifment of a proper butanical gaven at E*dioburgh; and from the fituation as well as the extent of the gardon at that time, joined to the finallnefs of its confermatories for plants, it could boalt of no riches in the way of exatics. The only feld for improvement, therefore, to the botanical Ithene, was the environs of Edinhurgh, to which it mut indeed be allowed that mature has been uncommonly liberal, in affording a very gleat variety of indegrenous vegetables. In this ficuation, the eftablifment of a new garden naturally fuggelled itfelf as a grand and important object; and it was arcomplifhed by the zal and induftry of Dr Hope, aided by the monificence of his prefent majelty. 'The frrll afflance griven to the undertaking was under the adminiftration of Lord Bate; and af. terwards, under that of the duke of Putiand, a permanent fund for the fupport of the butanical garden at this place was eltablimed, which may render it not inferior to any in Europe. Dr Hose's unwaried ex-

## H O P

ertions in procuring for the garden the vegetable pro. ductions of every climate, cuald not be excceded. His endeavous were conllantly dirested in adding not to the lhow, but to the riches of the garden; and they were employed with fuch fucesfe, that in a very flort time the intelligent butanit might gra:ify hio curio. fity, ia couternplating the rarefl plants of every country which has jet been explored. Nor were his indufious exertions more afiduoufy befowed in forming and enrichiny the garden, than in cheriming atd promoting a acal for botanical itudies. From but a very fmall number of lectures, which were all that his predeceffor ever gave, he gradually prolunged the courfe till it became as complete as any one delivered at this place; and daring ail this extended courfe, the taught in fuch a manner, as clarly demonitrated a degree of ardar and enthuliafin in himfelf, which could barcly fail to inipire fimilar enotions in others. But even fuch preespt, and fuch example, were not the conly means he employed for disecting the attention of the induftrious, i.agentons, and landably ambitious fudent, to this branch of fience. By beflowing, entireIf at has own expence, an anrual gold medal, a a a teltimony of fuperiur merit, he gave a fpur to cxertion, from which the toils of thudy wese alleviated by the Lue of farne, and the habous of indutry converied in. to the pieafures of emalation.

1) Hope married the daughter of Dr Sicvenfon $2 a$ earinent phyfician in Edinburgh; by whom he had fuur fons, and one datheter. Ho dided in N ovember 1786. Ile was a menber not only of the Ruyal So. ciety of Lomben, but alino of fevctal foreign fucitios; and at the time of his death he held the dittinguifhed office of freticint of the royal cultege of phighecians. Dr Hope, with whem it was a pris.a ipal object to make botany fublervient to the acto more imenedratly ufeful to life, and particularly to mediciue, was one of the firf whu, in conjuadion with the date Sir Alexander Dick, turned his attention to the practical cul. tivation of rhubarb in Gritain; and he demoultated the facinty with which it might be multiplisd. He lived to fee it cultivated in fuah abundance, that the Britifh market was too longer under any neceflity of depending upon fureign climates for this valuable and once expenfive medicinc; alfo he has fhown, that the afafertida plant, by proper attention, not only bears the vicifitudes of our climate, but grows in fuch a vigorous and health ful thate as to be fully impregnated with its active gum. There is therefore reafon to hope, that by the exertions of future indultry, the flop of the apothecary may be fupplied with this article allo from his own garden. Beffides being the awhor of fome papers in the Philufuphical Tranlactions, particularly two refoccting the ufful plants jot nerentioned, $\mathrm{Dr}_{\mathrm{r}}$ Hope had in contemplation a more extenfive botanical work, on which lie had bettowed much itudy and reflection. It was lis w fh to iacreafe thofe auvantages which refult from the very ingenious and uffiul aiti. ficial arrangement of Linuxus, by conjoining it with a fyftem of vegetables diltributed according to their great natural or ters. Fur this purpofe, nu inconflderable part of that tine which he cond faare from other unavoidable engagemenis was en.ployed in attemprs to improve and perfect natural method in the arang eo ment of regetables. In t.is work he had made vay

653 J H O P
confiderible protefefs; and it mut be the fubject of facetec regret to every luver of butany, if from the cverit of his death the public fhall be for ever deprived of thofe fruits of his lab, mes.

Hupf, in ethics, is the deffere of fome good, atcond. ed with a belief of the polijility, a: 1 aft, of obtaining it, and enlivened with $\mathrm{j} y, \mathrm{greater}$ or lefs, according to the greate or lefs prubability of our $p$ ofecting the abject of our hope. Alexander, preparing for his Alian expedition, diftributed his here diary duminions among his futends; alluting to fome willages, to othets bo. roughs, to others cities; and beine afled what he had referved for himfeti, replica, Hope.

Flor The wond is alfo ufed for that wooden trough in a mill, into ulich the com is put to te ground.

HOR, a mountain, or mountainous tract of Arabia Petrea, fituated in that circuit which the Ifraelites took to the fusth and fouth-eall of Edom in their way to the burders of Moab: on this mountain Aaron died. The indabitants were called Horites. This tract was allo called $S$ air, either from a native Horite, or from Efat, by way of anticipation from his hairy habit of body; whufe pofterity drove out the Horites.

## HORA. See IOURs.

IFORAEA, in antiquity, folemn facrifices, cmenfiting of fruits, sce. ofited in furiug, fummer, autumn, and winter; that heaven might grant milld and temperate weather. Thefe, according to Meurfus, were offered to the goddeffes called $\Omega_{t}$ at, i. e. Ifours, who were three in number, attended npon the Sun, prefided over the four feafons of the year, and had disine wormip paid them at A thens.

HORAPOLLA, or Horus Apollo, a gramma. rian of Panaplus in Egypt, aecording to Suidas, who firll taught at Alexandria, and then at Conftantinaple under the reign of Theodotius. There are extant under his name, two books on the hiernglyphics of the Egyptiars; which Aldus firtt publilhed in Greck in r 565 , in folio; and they have often been publifhed fince, with a Latin verfion and notes. It is not certain, however, that the grammarian of Alexandria was the author of thefe books; they being rather thought to belong to another Horapollo of more an(i) nt dute: on which head, fee Follricius's Billiotheca Grieta.

I10RATII, three Roman brothers, who, under the sign of Tullus Holilius, fonsht againt the three Corratii, who belonged to the Albanian army. 'Two of the Horatii wert firft killed; but the third, by his addrefs, fuceffively flew the three Curiatii, and by this victory rencered the city of Alba fubject to the Romans. See Rome.

1IORATIUS, furnamed Cooles from his lofing an tye in combat, was nephew to the conful Horatius Pukilus, and defended from one of the three brothers who fought againt the Curiatii. l'orfenma, laying frege to Rome, drove the Romans from Janienhum; and purfued them to the wooden bridge over the Titer, which joined the city to Janiculum. Largius, Hermimis, and Horatias Cocles, futained the fhock of the tiomy on the bridge, and prevented their entoing the city with the Romans; but Largius and Iferminios laving pafted the bridge, Heratims Cocles was left alone, and repuifed the enemy till the bridge wio broken under him: be then threw himfelf amod into the Tyter, fwam acrols the river, and entered Rame in trimmph

Hokntus ( (Ountus Flaccus), the mott cxallent of the latin prets of ale lyris and fatirical kind, and ithe mall judicios critic in the reign of Augullus, was the grendon of a freedman, and was born at Vemufitm of D. ('. He had the beft maflers in Rome, afur which le completed his education at Allons. IJavieg tahentip ans, he enhared the party of lirntus znd Coffins, but !eft his thicld at the battle of Philipri. Some time after, he gave hinfelf up entively to the Aucy of polite literature ard petry. His ta-
leats foon made him known to Aliguftus and Mecanas, who had a particular etteem for him, and loaded him with favours. Horace alio contracted a Atict friendhip with Agrippa, Pollio, Virgil, and all the other great men of his time. IIe lived withont ambition, and led a tranquil and agseeable life with his friends; but was fubject to a defluxion in his eyes. He died at the age of 57 . There are litl extant his Odes, Epilks, Satires, and Art of Puetry; of which there have beell a great number of editions. The bell are thofe of the Louvre, in $16+_{2}$, folio; of Paris, 1601 , quarto: of Cambridge, 1699 ; and that with Bemtey's emendations, printed at Cambridge in 17 II:
liORD, in geography, is ufed for a company of wandering people, which have no fettled habitation, but ftroll about, dwelling in waggons or under tents, to be realy to fhift as foon as the herbage, fruit, and the grefent province, is eaten bare: fuch are feveral tribes of the Tartars, particulary thofe who inhabit beyond the Wolga, in the kingdom of Aftracan and Bulgaria.

A hord confifts of 50 or 60 tent, ranged in a circle, and leaving an open place in the middle. The inhabitants in cach hord ufually form a military company or troop, the eldeft where of is commonly the captain, and depends on the general or prince of the whole naLion.

IIORDELM, barley, in botany: Agenus of the digynis order, belonging to the triandria clafs of plants; and in the natual method ranking under the $4^{\text {th }}$ order, Gramina. The calyx is lateral, bivalved, umiforous, and triple. The involuerum confils of fix leaves, and contains three flowers. There are eight fpecies; only one of which, viz. the murinum, or wall-barley-grafs, is a native of Britain. The mative flace of the vuldrare, or common barley cultivated in our fithe, is not known. For the cuiture, sic . of common barley, fee Agriculture, $n^{\circ} 139-146$.

HORDICALIA, or Hordicidia, ia antiquity, a religious feall held among the Romas, wherein they facriliced cattle big with young. 'Ehis feal feli on April 15. on which day they facrifieed 30 cows with calf to the goddefs Tellus or the Earth ; part of them were facrificed in the temple of Jupiter. The calves taken out of sheir bellies were burnt to aftes at tint by the pontifices, afterwards by the eldelt of the veltal virgins.

HORED, or Ores, a mountain of Aribia Petrea, contiguous to and on the fouth lide of mount Sinai; the fene of many miraculous appearances.

HORESTI (Tacitns), a people of Britain, berond Sulway Frith. Now Ifkdale (Camden).

HORI'IES, an ancient perple, who at the begin. ning dwelt in the monntains of Seir beyond Jordan (Gen.xiv. 6.) They liad princes, and were powerful, even before Elau made a conquefl of their country, (id. xxxi. 20-30.) The liorites, the defeendants of Seir, and the Edomites, feen afterwards to have been confourded, and to have campofed but one pecple (Deut. ii. 2. xxxiii. 2. and Judg. v. 4.) ' lhey dwelt in Arabia Petrxa, and Arabia Neferta, to the fouth eatt of the promifed land. We find the Hebrew word con Chorim, which in the book of Genelis is trannated Horites, to be ufed in an appellative fenfe in feveral other pallages of ferifture, and to fignify no-
und bies, or great and powerful men (: Kings xxi. 8, is. und Neh ii. 16. iv. 14 . v. 7 . vi. 17 vii. 5 . xii. 7 . Ecel. x.17. Ifa. xxxiv. :2. Jer. xxvii. 20. xxxix 6.) ; ard it is very probable that the Greeks derived from hence their berors in like manner as they derived Anaxe "a king," from the fons of Arak, the famous giant in Palelline.

HOREHOUND, DAllota, or Stachys, in botany. See Marrubiem.

HORIZON, or Horesox, in gengraphy and aftronomy, a great circle of the \{phere, divideng the world into two parts or hemifpheres; the one upper and vifible, the other lower and hid. The word is pure Greck, opt,", which literally fignifics "bounding or terminating the light ;" being formed of osbe. tiomino, defrio, " 1 bound, 1 limit;" whence it is alfo calIed finitor, "finither." Sce Astrowosy and Geography.

The horizon is either rational or fonfible.
Ralicmal, truc, or aftrenomical Horizow, which is alfo called fimply and abfelutely the borizon, is a great circle, whofe plane paftes through the centre of the earth, and whofe poles are the zenith and matir. It divides the fplere into two equal parts or hemifpheres.

Scufibl, vijible, or atparent Hokizov, is a leffer circle of the fphere, which divides the vilible part of the fphere from the invifible. Its poles, too, are the zenith and nadir: and confequently the fenfilie borizon is parellel to the raticnal; and it is cut at right angles, and into two equal parts, by the verticals....The ferfithe borizon is divided into eafern and weflern. The culfer: or ortive horizon, is that part of the horizon wherein the heavenly bodies rife. The zeflern or occidual horizon, is that wherein the flars fet. The altitude or elvation of any point of the fphere, is an arch of a versical circle intercepted between it and the fentible horizon.

By fenfle lovizon is aifo frequently meant a circle; which determincs the fegment of the furface of the earth, over which the eye can reach; called alfo the flafical borizon. In this fenfe we fay, a fpacious borizin, a narrow fcanty bosizon.

HORIZONTAL, fomething that relates to the horizon, is taken in the hurizon, or on a level with the horizon.....Wc fay, a borizomal plane, borizontal Line, \&c.

Hokizos:-1/ Dial, is that drawn on a parallel to the horizon: laving its gnomon, or Ayle, clevatel according to the altitude of the pole of the place it is defygoed for. Horizontal dials are, of all others, the molt fimple and cafy. The maner of sefcribing thens, fee under the article Dis:.

Mcrizontal Lime, in perfpective, is a right line drawn through the principal point, parallel to the horizon: or, it is the interfection of the horizontal and perfoctive planes. Sec Perspective.

Horizongal Plare, is that which is parallel to the horizon of the place, or nothing inelined thereto.

The bufinefs of levelling is to lind whether two - points be in the horizontal plane; or how much the deviation is. See Ifertlefig.

Hokizontal Plune, in perfpective, is a plane parallel to the horizon, pafing through the eye, and chi-ung the perfpestive plane at right anglez.

Hortzonral Projegion See Geography, no 65, 6y. Haim. Horizointal, Rumze, or Level Range, of a picce of ta! ordmance, is the line it defcribes, whe" directed purallel to the horizon or horizontal linc. Sce Gunneri, Horne. $f=1 / \mathrm{m}$.

Horizontar Mosh. See Astrusomy, n 3iq.
Honzontal Steculum. See Splectum.
HORMINUAT, clary, in botany: A genus of the gymnofpermia order, belonging to the didynamia clafs of plants; and in the natural method ranking under the tid order, F'reticillate. The calyx is campanulated, with four fegments nearly equal, the fourth larger, and emarginated; the upper lip of the corolla concave. There are feveral fpecies ; the moft remarkable of which is the verbenaceum, or common wild clary. It grows naturally on fandy and gravelly ground in many parts of Britain. It has fomctimes been called ocalus Chrifi, from the fuppofed virtuea of its feeds in clearing the fight, which it does by its vifeous covering; for when any thing happens to fall into the eye, if one of the feeds is put in at one corner, and the eyelid kept clufe over it, moving the feed gently alung the cye, whatever happens to be there will dick to it, and $f_{0}$ be brought ont. The virtues of this are fuppofed to be the fame as thofe of the garden clary, but not quite fo powerful.

HORN, in phyfiology, a hard fublance growin: on the hicads of divers animals, particularly the chovenfooted qualrapeds; and ferving them buth as weapons of offerice and defence.

The horn of animals is of the fame nature as their gelatinous matter; and is only that matter charged with a lefs quantity of water, and a larger quantity of earth, and fufficiently condenfed to have a firm and folid confillence. Dy digelling horn with water in Papin's digetter, it may be entirely converted into jelly.

Horn is a perfectly animalifed matter, and furnihes in ditillation the fame principles as all animal matters ; that is, at firlt a pure phlegm, with a degree of heat not exceeding that of boiling water; then a volatile alkaline fpirit, which becomes more and more penethating and Itrong; a ftid, light, and thin oil ; a concrete volatile fult, which forms ramilications upon the fides of the recciver; much air; fetid oil, which becomes more and more black and thick; and latly, it leaves in the retort a conliderable quantity of alinote incombullible cosal, from which, aftur its incineration, fcarcely any lixed alkali can be obtained.

Animal oil, and particularly that which is drawn firt in the diftillation of horn, is fufceptible of acquiring great thinaefs and volatility by repeated diftillations, and is then called the oil of chipe?

The horns of ttags, and of other animals of that kind, are the molt proper to furnith the animal oil to be rectified in the manner of dippt ; becanfe they yield the largell quantity. Thefe horns aifo diter from the herns of other animals in this, that they contain a larger quantity of the fame kind of carth which is in bones; hence they feem to poffefs an intermediate ma. ture betwixt hoins and bones.

> Hurt's-Horv. See hant's Horn.

Horvs make a conliderable article in the arts and manufactures. Dullocks horns, foftened by the fire, ferve to make latithorns, coinbs, knives, ink herris, to bacco buses, \&ic.
6

Dyeriig f Hokn- Dack is performed by llapins braf in agha fortis till it be romotel green: with tho the bom in to le walled ance or twiece, and they put into a wamed ciccelion of ligwood and water. Grein is begua by boiling it, Sce. in alum water; then with vedderife, ammonac, and white wine vinegar ; kerping it hot therein till fufficienty gren. Red is he-
 cuetion in a liquor compoun :ad of guink lime fle ped in tain water, trainod, and to cvery pint an ounce of Beanil word adied. In this dececti a the bone, Ac. is 1, be boikd till fuffecienty red.

Dr Lecu is informs us that hotns receive a deephack Atain from follotion ifive. It ought to be dhated to fuch a destee as not lentibly to corrode the funject; and applid two or three times, if neceflary, at conti. derable intervale, the matter being expofed as much as poffille to the cma, to halten the appearance and deepening of dice colcur.

Lyairs or fainirg Forv to imitate Tormilegball.The hoan to be dyedmut be fint preffed into proper plates, fale, or other fat form ; and the following inixture prepared. Take of quick-lime two pars, and of litharge ene part; temper them toguther to the confiftence of a foft pale with fuap-ley. Put this pafte over all the parts of the horn, except fuch as are proper to be left tranfarent, in order to give it a nearer refemblance of the tortuife thell. The horn moft remain in this manner covertel with the patle till it be thorouglly dry; when, the pate being brahled off, the hern will be found partly opaque and partly tranfpa:ent, in the manner of tritite-theil; and when put over a foil, of the kind of latten called affulue, will be faretly dittinguifhalle from it. It requins fome degree of fancy and judgment to dipu fe of the pate in fuct a manuer as to form a varicty of tranifparent parts, of difeerent magnitudes and figures, to look like the thect of nature : and it will be an improvement to add fenituanfparent parts; which may te dome by mixing whiting with fume of the pafte to weaken its operat tion in particular places; by which fpots of a reddth brawn will be produced, which if properly interfper. fed, efuecially on the edges of the dark parts, will geatly increafe both the beaty of the work, and its fimilitude with the real cort ife-foel.

Hors is who a fort of mufical imftrment of the wind kind; chicfly ufed in humting, to anmate and bring together the dogs and the huaters. The term ancently was, zurol a born, all horns being in thofe times compaffed ; but funce traight horns are come in faftoon, they fay how a born, and fometimes formit a
 chent, idouble recher, roll recheat, ruaning or farewill pechear, Sa SeRichiat.

## H O R

be taken to keep it clear, as it is apt to be clogged by a thin fluid that gradually oozes out and fills up the paffage. Some have practifed fawing off the horn; but, according to the beft obfervations, it does not fucceed beiter than boring. From the cafes Dr Tufts has feen, he is led to conelude that injections are in general unneceffary; that, when the diftemper is early difeovered, no more is required than a proper opening into the horn, keeping it fufficiently clear for the admiffion of frefh air, the removal of the compreffion, and the difcharge of floating matter. But when the diftemper has communicated its effects to the brain, fo as to produce a high degree of inflammation, it is much to be doubted whether any method of cure will fucceed.

Hors-Fib, Gar-fin, or Sea-Needle. See Esox.
Hokn-Work, in fortification, an outwurk compofed of two demi-baftions joined by a curtain. See Fortification.

HORNBY, a town of Lancafhire in England, feated on a branch of the river Lune, and beautified with a handfome parochial chapel. The ruins of a decayed caftle are ftill to be feen here. W. Long. 2 . 20. N. Lat. 54 . 6.
hor.v.castle, a town of I-incolnthire in England. It had a cattlr, as the name imports; from the architecture of which, and the Roman coins that are fometimes dug up here, it is thought to have been a camp or flation of the Romans. The town is well built, and is almolt furrounded with water. It is a figniory of 13 lordfhips. In thefe lordfhips there are feveral chapels for the convenience of the inhabitants, who are at too great a diffance from the mother-church, and pretty numerous. It has a market on Saturdays, and fairs in June and Augutt.
HORNDON, a town of Effex, in En land. It flands near a rivulet, that at a fmall diflance from hence falls into the Thames, which is there called the Hope. E. Long. O. 30. N. Lat. 51. 20.

HORNECK ( Br Anthony), a learned and pious divine, was born at Baccharach, in the Lower Palatinate, in $\sigma_{\neq 1}$. He fudied divinity under Dr Spanheim at Heidslberg; and afterwards coming to England, eompleted lis Itudies at Oxford, and became vicar of Allhallows in that city. In 1665 , he removed into the family of the duke of Albemarle; and was tutor to his grace's fon, then lord 'torrington. The duke prefented him to the rectory of Doulton in Devonfhire, and procured for him a prebend in Exeter. He was afterward chofen preacher of the Savoy. In 1693, he was collated to a prebend in Wellninfter, and the fame year admitted to a prebend in the cathedral of Wells. He publifhed, 1. The great $I_{3}: \%$ of confideration. 2. The happy afcetick. 3. Delight and judgment. 4. The fire of the altar. 5. The exercife of prayer. 6. The crucified Jefus. 7. Several fermons, and other works. He died in 1696, and was interred in Weltminfter abbey, where a monument is erected to his memory.

HORNERS, thofe people whofe bufinefs it is to prepare various utenfi's of the horns of eattle. The horners were a very ancient and confiderable fraternity in the city of London fome bundred yeare ago. In the reign of Edward II. they complained to parliament, that by foreigners huying up the horns in Eng-

Vol. VIIl. Part 11.
land, they were in danger of being ruined, and this bufnefs loft to the nation. For this reafon was made the flatute 6 Edw. IV. by which the fale of horns to foreigners (exeept fuch ay the faid horners refufed) was prohibited; and the wardens had power granted them to fearch all the markets in London and 24 milea round, and to infpect Sturbridge aud Ely fairs, to prevent fuch practices, and to purchafe horns at fared prices. But on plautible pretences this law was repealed in the reign of James I. and thereupon the old evil revived. The horners again applied to parlia. ment, and king Edward's hatute was renewed (excepting as to the infpection of the fairs), and fill remaine in force. The importation of unwrought horns into this country is alfo prohihited. In 1750 , there were exported to Holland 514,500 lantern leaves, befides puwder flafks. There was formerly a duty of zo hilllings a thoufand, under which in 1682 were exported 76,650 ; but io the reign of George I. this duty was taken off, and thefe and all other manufaetures made of horns may be exported free. The prefent company of horners were ircorporated January 12. $163^{8}$; and confift of a mafter, two wardens, and nine affitants, without livery or hall. They lave a warehoufe in Spitalfields, to which the horns are fent as brought from town and country markets, and thenee regularly civided, the widows and orphans of deceafed members having equal fhares.

HORNist, in zoolngy, a fpecies of wafp. See Vespa.

HORNING, in Scots law, a writing iffuing from the fignet, in his majelty's naine, at the inltance of a creditor againlt his debtor, commanding him to pay or perform within a certain time, under pain of being declared rebel, and by a caption put in prifon.

HORNIUS (George), profeflor of hiftory at Leyden. was born in the Palatinate, and died at Leyden in 1670 . He was a litule maniacal towards the end of his life; which diforder was fuppofed to te occa. fined by the lofs of 6000 florins he had entrulled with an alchemilt at the Hague. His works are, 1. Hijpuria Ecelefiaflica ad an. 1666. This has been well elteemed. 2. De Origimilus Americanis, 1652. 8vo. 3. Geographia Frtus \&o Novs. 4. Orlis Politicus. He was a man of valt reading, rather than great parts.

HORNSEY, a town in Yorkhire, 188 miles from London. It is almolt furrounded by a fmall arm of the fea; and the church having a ligh tteeple, is a noted fea-mark. Not inany years ago there was a firect here called Hornfy leck, which was wafled away by the fea, excelt: a houfe or (wo. E. Long. C. 6. N. Lat $5+0$.

Horssey, a town of Mddefex, five miles nortl. of London. It is a long Itraggling place, fituated in a luw valley, but extremely pleafant, having the new. river winding through it. Its eliurch, of which High. gate is a hamke, is fuppofed to be built with the fones that came from Lodge-Hill, the bithop of London's hunting-feat in his park bere; it having been his manor from the moft ancient times. Ahour a nile nearer this is a coppice of young trees, calted Hornfey accou, at the entrance of which is a public houfe, to which great numbers of perfons refort frum the city. This houfe being fituated on the rop of a hill, affords a deligh ful profpect of the neighbruring country.

HORNPIPE, a common inltrument of mufic in $+\mathrm{N}$

Wales,

## Hornct

It robo- Wialec, confining of a woodea pipe, with holes at hagrun', Horofeape tid didances, and a horn at cach cide; the one to col. St the wind blown into it by the mouth, and the
other to carry off the founds tis modulated by the perjormer.

Horspipe is alto the name of an Engliha air, prohathy derived from the abore indrument. Tle nicafare of this air is triple time, with fix crothets in a bar ; four of which are to be beat with the laad Juwn anl tworni.

HOROLOGIUM, Desary (empufel of aparana, "time, homr," and son "fpech, difeomfe"), a
 or machine for meafuring the hours; (he Cakonoms. TER).-Such are our clocks, watches, fundais, ac. Sue Clock, Watch, Disl, an! Clepsyopa.

Mondern inventions and gradual impromements, have given biuth to fome now terms that come properly under this head, and anmexed new moanings to others totally different from what they had orisinally. All chonometers that announced the hour by lliking on a bell, were called chocks: thas, we read of porketclocks, though nothing could fecm more abfurd than in fuppofe that a clock, accordint to the modern idea, fond be carricd in the pecket. In like manner, all cluck that dial not trike the hour were calld augthes or time pieces; and the difirent parts of a friking cluck were dillinguibed by the watch part and the elockpant: the former meanins that part which ineafures the time, and the latter the part which proclaims the the hours. In the repoit of Sir lfaac Newton to the houfe of commons, anmo 1713 , rlative to the longi cude act, he Aates the diflimaltics of afcertaining the longitude by means of a watel : yet it is obvious, from feveral circumfances, that his remarks were direetly to be underfood of a time-picce regulated by a pens.ulum; for his objections are founded on the known properties of the pendulum, fome of which differ ef. fentially from the properties of the balance and fpring. It is alfo to be remembered, that all the attempts of Buygens for finding the longitude were by means of pendulum clucks that did not lltike the hour, and conficomaty, according to the language of the times, were ghled autches. At this time fuch machines for meafuring time as are fixed in their place are called clocks, if they frike the hour: if they do nut frike the hour, they are called time fieces; and when conftruted with more care, for a more accurate meafure of time, they are called resulators. Some artilts of lase have affected to call fuch watches as were confructed for aftronomical and nautical obfervations by the mame of timefieces, probably to intinate that they pofefs the advantages of thofe conilructed with a pendulum.

Mr Juhn Harnifoa firlt gave the name of time-Leceper to his watch, for the performance of which he received trom parliament the fum of L. 20,000. See Longitude.

For the aceount of the principles of this machine, fee Time kelper. And fur the chicf inprovements that have been mate for the more accurate neafure of thime, fec Pallats, Penduluna, and Scapement.

HOROSCORE, in altrology, the degice or point of the heawno ithy ahose the catern point of the ho. rizon at any given time when a prediction is to be made of a future cerent: as, the fortunc of a perfon
then born, the fuccefs of a delign then laid, the :rea.

We call it, more peculiarly, candubing a natioty, when the life and furtane of a perfon are the futject of the pudiction; for they draw heroicopes of cities, great chterpnizes, \&e. See Hover.

## horoscopy. See Divivation, noz.

HORREA, in Ruman antiquity, were pubic magaziues of cern and falt metat, vut of which the foldiers were funifhed on thir march in the military ruads of the empire. Horrea was alio the name which they give to thicir granaries.

HORROX (Jramiah), an eminent Englifh aftronomer in the ifth century, was hom at Texteth near Liverpool in Lancalnire in 161 g . He died, to the great lofs of that fcietice aind of the world, in the 23 d year of his age, after he had jut finifhed his $V$ ? nus in fole aifa; which, with fome other works, were pullifhed by Dr Wallis, in quarw.

HORROR, Arictly liguities fuch an excels of fear as makes a perfon tremble. See Fear, Fricht, and Terkor. In medicine, it denutes a fhivering and Making of the whole budy, coming by fits. It is com. mon at the beginning of all fevers, but is particularly remarkable in thofe of the intermittent kind.

Hornor of a Facuun, was an imaginary principle a mong the ancient philofoplicrs, to which they aforibed the afcent of water in pumps, and other limilar phenomena, which are now known to be occafoned by the weight of the air.

HORSE, in zoology. See the anticle Equus.
Horfes were vaty rate in Judaa till Solomon's time. Before him we find no horfemen mentioned in the armies of Ifrael. David having won a great battle againfl Hadadezer king of Stobah (2 Sam. viii. 4, 5.), took 1700 hoores, and lamed all belonging to the chariuts of war, teferving only 100 chaiots. I he jadges and priaces of 1 frael ufed generally to ride on nules or afies. After David'stime, horfes were more common in the country of Judah, \&c. Sulomon is the firt kins of Judah who had a great number of horfes, and he kepi them rather for pomp than for war; for we do not read that he made any military expeditions. He had, fays the feripture (1 Fingsiv. 26.) 40,000 flalls of horfes for his chariuts, and 12,000 horfemen diltributed in his fortifed places (1 Kings x. 26.) He had bis horfes from Exypt (izid. ver. 28, 29.) ; and there was not a fit which did not coft him mere than 600 thekels, which make of our money about gol. Moies had forbiden the king of the Hebrews to keep a great number of hories (l)eut. xwii. i( 6 ), ket at any time he fhould be incibed to carry the people back into Egypt.

We read in the fecond book of Fings (xxiii. 17.), that Jofiah took away the horfes whicin the kings of Judah his predecefiors liad confecratcei to the fun. We bruy
fe. know the fun was wrimipped over all the eaft, and that the hoore, the iwiftelt of taty healts, was confecrated to this deity, who was repiefented as riding in a chariat drawn ${ }^{\prime} \mathrm{y}^{\prime}$ the mold beautiful and fwifte? horfes in the world, and foufuming every day his journey from eath to we? m onder to communicate his light to mankind. X.nophon defctibes a folemn fa. crifice of horita, which was mare with eeremony to the fon: they were all the fineft fleeds, and were led with a white chariot, crowned, and confecrated to the fame god. We may belicee that the horfes which Jofiah removet out of the coust of the temple, were ap. pointed for the like facrifices. Plie rabbins inform ts, that thefe hories were evcry morning put to the chariots delica:ed to the fun, whereof there is mention made in the fume book: and that the king, or fone of his officers, got nis and rode to meet the fun in its riling, as far as from the callern gate of the terple to the fuburbs of Jerufalem. O:licrs are of opinion, that the horles mentioned in the book of kings were of wood, tiont, or metal, erected in the temple in honeur of the fun: Others, that they were horfes which none were permitted to ride or fallon to the yoke. but were free, and left to themfelves, like thofe which Julius Ciefar let loofe and let at liberty af. ter his palfage of the Rubicon.

Ho:les were ufed both amongh the Grecks and Romans in war, but were not originally very numerous; for as each horfeman provided his own horfe, few would be able to bear the expence. Horfes for a confiderable tine were managed by the voice alone, or by a fwitch, withat bride, faddle, or Atirrups. Their harnefs was kins of bealts, or fometimes cloth. Both horfes and men anongt the Greeks underwent a fevere probation luefore their admition into the cavalry. -Horfe-races were common amonst the Greeks and Romans, and the place where they ran or breathed their courfers was called bifpodromus.

Managem:nal of a Horse upon and aflor a Gourney. See that his thues be rot too thrait, or prefa hais feet, but be exactly flaped; and let him the thod fome days before you begin a journey, that they may be fettiled to his feet.

Obferve that he is furnilhed with a bitt preper for him, and by no means too heary, which may incline him to carry low, or to ref upon the hand when he grows weary, which horfemen call making aje of has frib leg.

The nouth of the bitt thoult relt upon his bars about half a finger's.breadil from his tufhes, fo as not to make him frumble his lips; the curb thould rell in the hollow of his beard a little above the chin; and if it gall him, you muat defend the place with a piece of buff or other fuft leat leer.

Take notice that the faddle do not rell upon his Withers, reins, or back-bone, and that one part of it do nut prefs his tack more than another.

Some ridera gall a horfe's fides below the faddle with their tirrup-leathers, efpecially if 120 be lean; to hinder it, you mould fix a leather Irap between the points of the fore and hind-bons of the faddle, and make the flirrup.leatler pafs over them.

Begin your journey with flont marches, efpecially if your borfe has not been exercifed for a long time: fufier him to fale as often as you find tim inclined;
and not only fo, but invite him to it: but do not ex. cite your mares to tlale, becaufe their vigour will be thereby diminifled.

It is advifalle to ride very foftly, for a quarter or balf an hour before yon arrive at the inn, that the horfe not being too warm, nor out of breath, when put into the Hable, yoa may unbridle him: but if your buffinefs obliges you to put on flarply, you mal then (the weather being warm) let him be walked in a man's hand, that he may cool by degrees: otherwife, if it be very cold, let him be coeered with eloths, and walked up and down in fome place free from winel: but in cale you have not the conveniency of a matered walk, Ilable him forthwith, and lit his whole body be rubbed and dried with fraw.

Although fome poople will have their horfes legs rubbed dom with fraw as foon as they are brought into the Atatle, thinking to fupple them by that means; yet it is one of the greatell errors that can be comraitted, and produces no other effects than to draw down into the legs thofe humours that are always firred up by the fatigue of the journey: not that the rubbing of horfes legs is to be difallowed; on the contrary, we highly approve of it, only wouid not have it done at their firit arrival, but when they are perfectly conled.

Being come to your inn, as foon as your horfe is partly dried, and ceafes to beat in the flanks, let him be unbricled, his bit wafled, clcanfed, and wiped, and let him eat his hay at pleafure.

If your horfe be very dry, and you have not given him water on the road, give him oats wahed in good mild alc.

The duft and fand will fometimes fo dry the tongues and mouths of hories, that they lofe their appetites: in fuch cafe, give them bran well moilened with water to cool and refrefh their mumbs; or wafh their mouths and tongues with a wet fpunge, to obligethem to cat.

The foregoing directions are to be obferved afte: moderate riding ; but if you have rude exceffively hard, uniadde your horf, and ferape off the fweat with a fweating knife, or fcraper, holding it with both hands, and going always with the lair; then rub his hced and ears wish a large hair-cloth, wipe him alfo between the fore-legs and hiind-tegs; in the mean witite, his body thould be rabbed all over with ftraw, efpecially under his belly and beneath the faddle, tiil he is thuroughly dry.

That done, fet on the faddle again, cover him; and if you liave a warm place, let him be gently led up and dowa in it, for a quarter of an hour; but if not, let hind dry where he tands.

Or you may unfuddle him immediately ; fcraps off the fiweat; let the oftler take a little vinegar in his mouth, and fquirt it into the harfe's; then rub his head, between the fore and hind-legs, and his whele body, till he is pretty dry: let him not drink till thorouglly cnol and has eaten a few oass; for many, by drinking too foon, have been fpuiled. Stt the faddle in the fun or by a fire, in order to diy the pannels.

When horfes are arrived in an inn, a man hould, before they are unbrided, lift up their fees, to fee whether they want any of their fhocs, or if thofe they

## HO K 1060 i $\quad$ H O R

Horfe. have do net reft upon theix fides; afterwards be thould pick and clear them of the earth and gravel, which may be sot betwixe their thoes and foles.

If you water them abroad, upon their return from the river caufe the ir feet to be lopped with cowdong, which will cafe the pain therein : and if it be in the evening, let the dung continue in their feet all night, to keep them foft and in good condition: but if your horfe have brittle feet, it will be requifite to anoint the fore-feet, at the on-letting of the hoofs, with butter, oil, or hog's.greafe, before you water him in the morning, and in dry weather they fhould be allo greafed at noon.

Many horfes, as foon as unbridled, inftead of eating, lay themflues down to rett, by reaton of the great pain they have in their feet, fo that a man is apt to think them fick: but if he looks to their eyes, he will fee they are lively and good; and if he offers them meat as they are lying, they will eat it very willingly; yot if he landles their feet, he will find them extremely hot, which difcovers their fuffering in that part. Yon mult therefore fee if their thoes do not relt upon their foles, which is fomewhat difficult to be certainly known withont unfhoeing them; but if you take off their moes, then look to the infide of them, and you may perceive that thole parts which reit upon the foles are more fmooth and fhining than the others: in this cafe you are to pare their feet in thofe parts, and fix on their thoes again, anointing the boofs, and ftopping the foles with fcalding hot black pitch or tar.

After a long day's journey, at night feel your horfe's back, if he be pinched, galled, or fwelled (if you do not immediately difcuver it, perhaps you may after fupper), there is nothing better than to rub it with good brandy and the white of an egg. If the galls are between the legs, ufe the fane romedy; but if the ofler rulss hiin well between the legs, he will feldom be galled in that part.

In order to preferse horfes after travel, take thefe few afeful inlluctions. When you are arrived from a journey, inmediately draw the two leet-nails of the fore-feet; and, if it be a large fhoe, then four: two or three days after, you may blood him in the neck, and feed him for 10 or 12 days only with wet bran, without giving him any oats; but keep him well lit. tered.

The reafon why you are to draw the heel-nails, is becaule the heels are apt to fwell, and if they are not thos eafed, the floes would prefs and traiten them too much: it is alfo advifable to fop them with cowdung for a while; but do not take the moes off, nor pare the feet, becaufe the humours are drawn down by that means.

The following bath will be very ferviceable for preferving your horfe's legs. Take the dung of a cow or ox and make it thin with vinegar, fo as to be of the condifence of thick broth; and having added a landful of fmill falt, rub his fore-legs from the knees, and the hind-legs from the gambrels, chating them well with and againt the hair, that the remedy may fink in and flick to thofe parts, that they may be all covered over with it. Thas leave the horfe till morn. ing, not wetting his legs, but giving him his water that creang in a fail: next morning lead him to the ri-
ver, or walh his legs in well-water, which is sery good, and will keep them from fwelling.

Thofe perfons, who, to recover their horfes feet, make a hole in them, which they fill with moiltened cow-dung, and keep it in their fore-feet during the fpace of a month, do very ill; becaufe, though the con'inual moiture that iflues from the dung occaloons the growing of the hoof, yet it dries and fhrinks it fo exceflively when out of that place, that it fplits and breaks like glals, and the foot immediately flraitens. For it is certain, that cow-dung (contrary to the opinion of many people) fpoils a horfe's hoof: it does indeed moilten the fole: but it dries up the hoof, which is of a different nature from it. In order, therefore. to recover a horfe's feet, inttead of cow-dung, fill a hole with blue wet clay, and make him keep his fore-feet in it for a month.

Moft horfes that are fatigued, or over-rid, and made lean by long journeys, have their flanks altered without being purly, efpecially vigorous horfes that have worked too violently.

There is no better method to recover them, than to give each of them in the morning lalf a pound of honey very well mingled with fealded bran; and when the readily eat the half pound, give them the next time a whole one, and afterwards two pounds, every day continuing this courfe till your horfes are empty, and purge kindly with it; but as foon as you perceive that their purging ceafes, forbear to give them any more honey.

You may adminifter powder of liquorice in the fcalded bran for a conliderable time : and to cool their blood, it will not be improper to let them have three or four glitlers.

In cafe the horfe be very lean, it is expedient to give him fome wet bran, over and above his proportion of oats; and grafs is allo extraordinary bencficial, if he be not pury.

If ic be a inare, put her to a horfe; and if the never harl a foal before, it will enlarge her belly.

Somerimes excclive fecding may do horles more harm than good, by rendering them fubject to the farcy. You frould therefore be cantious in giving them too great a quantity at a time, and take a little blood from them now and then.

When a horle begins to drink water heartily, it is a certain lign that he will recover in a fort time. As to the method of giving him water during a journey, obferve the following rules:

All the while you are upon a journey, let your horfe drink of the firt good water you come to, after feven o'clock in the morning if it be in fummer-time, and after nine or ten in winter.

That is accounted grod water which is neither too quick and piercing, nor too muddy and flinking.
'Ihis is to be done, anlefs you would have bim gallop. a long time after drinking; for if fo, you mult forbear.

Though it is the cuflom of England to run and gallop horfes after drinking, which we call watering: courfes, to bring them (as they fay) into wind; yet, fays M. de Solleyfel, it is the mot pernicious practice that can be imagiaed for horfes, by which many are ren. dered purfy.

White a horle is drinking, draw up his head five or fix times, making him move a little between every. draught;

## H O R

draught; and notwi hftandiag he be warm, and fweat very much, yet if he is not quite out of breath, and you have ftill four or five miles to ride, he will be better after drinking a little, than if he had drank none at all : it is true, indeed, that if the horfe is very warm, you fhould, at coming out of the water, redouble your pace, to make him go at a gente trot, to warm the water in his belly.

You ought to let him drink after this manner during the whole time of your journey; becaufe, if when you happen to bait he be hot or fweaty, you mult not let him drink for a long time, as it would endanger his life; and when his bridle is taken of, his exceflive thirlt will hinder him from eating, fo that he will not offer to touch his mat for an hour or two, which perhaps your occafions will not allow you for a baiting time, and not to have any food will render him unfit for travel.

If you meet with any furd before you come to your inn, ride the horfe throngh it two or three times, but not up to his belly: this will only cleanfe his legs; but the coldnefs of the water will bind up the humours, and prevent them from defcending.

If $y$ our hurfe has been very warm, and you have not had the conveniency of watering him upon the road, he will, when unbridled, eat but very little; therefore be fhould have his oats given him wafhed in ale or becr, or only fome of them, if you intend to feed him again after lie has drank.

Some are of opinion, that horfes are often fpoiled by giving them oats before their water; becaufe they fay the water makes the oats pafs two foon, and out of the ftomach undigelted. But M. de Sollcyfel affirms, that though it be the common cuflom not to do it till after, yet it is proper to feed with oats both before and after, efpecially if the horfe be warm, and has been hard rode; for they will be a great deal the better for it, and in no danger of becoming fick.

Breeding of Horses. When the thallion is clofen, and all the mares intended for him are collected together, there oult be another flone-horfe, to difcover which of the mares are in heat; and, at the fame time, contribute to inflame them. All the mares are to be brought fucceffively to this floue-horfe; which mould alfo be inflamed, and fuffered frequently to meigh. As he is for leaping every one, fuch as are not in heat keep him off, whilt thofe which are fo fuffer him to approach them. But inftead of being allowed to fatisfy his impulfe, he mult be led away, and the real fallion fubftituted in his ftead. This trial is neceffary for af. certaining the true time of the mare's heat, efpecially of thofe which have not yet load a colt ; for with regard to fuch as have recently foaled, the beat ulually begins nine days after their detivery; and on that very day they may be led to the fallion to be covered; and nine days after, by the experiment ahove mentioned, it may be known whether they are till in heat. If they are, they mult be covered a fecond time; and thus fucceffively coery minth day while their heat continues: for when they are impregnated, their heat abates, and in a few days ceafes entirely.

But that every thing may be done eafly and conveniently, and at the fame time with fuccers and advantage, great attention, expence, and precaution are requifite. The ftud mult be fixed in a good foil,
and in a fuitable place, pr portioned on the number of mares and ftallions iate ded to be ufed. This foot mult be divided into feveral parts, inclofed with rails or ditches well fenced; in the part where the pafture is the richeft, the mares in fold, and thele with colts by their fides, are to be kept. Thofe which are not impregnated, or have not yet been covered, are to be fcparated, and kept with the fillies in another clofe, where the palture is lefs rich, that they may not grow too fat, which would obftruct the progrefs of generdtion. Lallly, the young llone colts or geldings, are to be kept in the drielt part of the fields, and where the ground is mof unequal ; that by running over the uncyen furface, they may acquire a freedum in the motion of their legs and fhoulders. This clofe, where the flone colts are kept, mult be very carcfully feparated from the othcrs, left the young horfes break their bounds, and enemaie themfelves with the mares. If the tract be fo large as to allow of dividing each of thefe clofes into two parts, for putting inexn and, horfes into them alternately, the patture will lat much longer than if continually eaten by horfes; the ox improving the fertility, whereas the horfe leffens it. In each of thefe clofes fhould be a pond; Handing water being better than running, which often gripes them: and if there are any uces in the ground, they hould be left flanding, their flade being very agreeable to the horfes in great heats; but all teins or ftumps frould be grubbed up, and all holes levelled, to prevent accidents. In thefe paftures your horfes chould feed during the fuinmer ; but in the winter the mares fhould be kept in the Itable and fed with hay. The colts allo mut be houfed, and never fuffered to feed abrnad in winter, except in very fine weather. Stallions that ttand in the Itable fhould be fed more with ftraw than hay ; and moderately exercifed till covering time, which generally lafts from the beginning of April to the end of June. But during this feafon they fhould have no other exercife, and be plentifully fed, but with the fame foud as ufual. Before the Itallion is brought to the mare, he fhould be dreffed, as that will greatly increafe his ardour. The mare mult alfo be curried, and. have no thoes on her hind feet, fome of them being ticklifh, and will kick the fallion. A perfon kold. the mare by the halter, and two others leal the Itallion by long reins; when he is in a propel fituation, ano.. ther afiltant carefully directs the yard, pulling afid= the mare's tail, as a fingle hair might hurt him dangeroufly. It fometines happens that the ftallion does not complete the work of gencration, coming from the mare without making any injection: it fhuuld therefore be attentively obferved, whether, in the laft mo.. ments of the copulation, the dock of the fallions tall. has a vibrating motion; for fuch a motion always accompanies the emifion of the feminal lymph. If he: has performed the act, he muit on no conlideration $b$ :fuffered to repeat it; but be lead away diectly to :lis ttable, and there kept two days. For, however able a good ilallion may be of covering every day during the three monthe, it is much better to let him be led to a mare only every other diy: his produce will be greater, and he himitelf lefs exhauted. Dering the firt feven days, let four different marcs be fuccellively brought $t 2$ him; and the ninth day let the lirtt be again brough,., and fo fucceflively while they concinue in heat : but da
fone as the locet of any one is mer，a fueth mare $i$ of
 days：and as ferera！ratuln even at the foll，lecond，or thit！fime，it is computed that a dallion，by fuch ma－ ragenten，may，durin；the thric monthe，cuser is or 18 mares，and beget 10 or 12 cols．There animals have a very large quantity of the Ceminal lymph；io that a conliderable portion of it is find during the emithon．In the mates lik wide is an emifoon，or re－ ther dithilstion of the kentral lymph，during the whole time shoy are hording ececting a vifeil whitholymph， called the ha／s，which ceate on eonception．This intor the Cotectes callad formones aid pretended that phottes might be made of it，one tenarkable of－ $f_{f}$ Et of which was，to render a horfe irante with luth． ＂h his hippomanes is very difeeent from that found in the fecundines of the foal，whirh M．Daubenton firt ciforosed，and has to acouri：tely deleribed its nature， urigin，and lituation．The ejection of this ligurer is the mon ccrain fign of the mare＇s heat；but it is alfo known ber the infation of the lower part of the valva， by her freouent neighors，and athempes to get to the hoofes．fifer being covered，nothing more is requi－ tite than to lead her away to the thide．＇The firth foal of a mare is newer fo throngly formed as the the ered－ ing ；fo that care hoold he taken 10 proenre for her， Whe firt time，a larger flallion，that the defect of the frow th may be compenfated by the largenef of the fize．Particuar regard foould alfo be had to the dif－ Ference or combuity or the fathion of the tallion and the mare，in order to correct the faults of the one by the ferfections of the other：efpecially never to make any difpoportionate copulations，as of a fmall horfe with a large mare，or a large horfe with a fmall mare；as the preduce of fuch copulation would be fonall，or badly preportioned．It is by gradations that we mult thdeavar io arrive at natural beaty：for intlance，to give to a mare a litte too clumfy，a well－ made horfe and linely flaped；to a finall mare，a horfe a liste higher；to a mare which is faulty in her fore－ hand，a horfe with an tegant bead and noble cheit，人⿵⿸⿻一丿又子乚．

It las been oherved，that horfes for！in dry and light grounds．produce temperate，fwift，and vigorons foas， with mufcubar legs and a hard hoof；while the fame bred in manfles and moill patures have produeed foals with a large heavy head，a thick carcafe，chonfy legs，bad hoofs，and broad fect．＇Thefe differences pro－ ceed from the air and food，＂hichis cafly underllood： but what is more diffecule to be aecommed for，and lill more efential than what we have hitherto obfersed，is， to be continually croffeg the breed to prevent a dege－ neracy．

In coupling of horfes，the colour and fize fhould be fuited to eachuther，the thape contraned，and the breed crofled by an uppotition of climates：but holfes and mates foaled in the fame thod thould never be juined． Thefe are enential articles；but there are others which fhoulh $t y$ no means be neglected：as that no fhort－ douked mares be fuftered in a 1 ud，becaule from their heing mable to keep ofl the flies，they are much mone tormented by them than others which have a long fiverp－ ing tail；and their continual agitations from the llings of thale infects，ocations a diminution in the quantity
$\therefore$ their milk，and has agreat influence on the conpitu． wom an ？the of the colt，which will be vigorons en pro－ portiou as its dam is a cool murfe．Cate matt alo be iaken，that the tai！makes be forl is have been a！ivays bronghe a in paturts，and wever over worked．Nares which have always been broul？up in the flable on dry food，andafterwards turned to grafs，d，ust breed at filt：fome time is sequired for acenthoming them to this new aliment．

Though the urual feafor for the heat of mares be from the beginning of April the the of Jans，yet it is not useommm to fud fome amons a laffe num－ ber that are in heat before that tine：but it is ade vifuble to let this heat pars over without givity them to the fallion，becaute they would foal in winere；and the colts，buldes the in lemency of the feafon，would have bat milk for their nomrithment．Again，if the meres are not in heat till after the and of June， they hasald not be covered that dealun；becanse the colts behag fouded in fummer，have not time for acquiring dreagh finticiat to repel the injuries of the following wi：ater．

Many，inflead of bringing the ftation to the mare， tuin him loofe into the cloke，where all the mares are booushe together：and there leave lim to choofe fuch as whll thand to him．This is a very advantageous me－ thod for the mares：they will always take horfe more certaiuly than in the ether；but the llallion，in lix weeks，will do himfelf more damage than in feveral years by moderate exercife，conducted in the manner we have already mentioned．

When the mares are pregnant，and their belly be－ gins to fwell，they muit be feparated from thofe that are not，left they hurt them．They ufually go it montis and come days；and foal thanding，whereas mott othe： quadrupeds lie down．Thofe that cannot foal without great dificulcy，mot be afliled；the foal mut be placed in a proper lituation ：add fometimes，if dead，drawn out wht cords．＇I he head of the colt ufuaily prefents itfelf lird，as in all other animals：at its coming out of the matrix，it breaks the fecundines or integuacots that inclore it，which is acompanied with a great Hux of the lymph contaned in them；and at the fame time one or more folid lumps are difenaged，furmed by the fedment of the infpilted higuor of the aliantoides． ＇This lamp，which the ancionts called the bippomanes of the colt，is fo far from being，as they inagined，a maits of then adhering to the head of the colt，that it is fe－ parated from it by a membrane called amnois．As foon as the colt is fallen，the mare licks it，but with－ out tonching the hippomanes；which points out ano－ ther error of the anciente，who afinmed that the in－ flatrly devours it．

The gencral cuftom is to have a mare covered nine days after her foaling，that no time may be luft；but it is certain，thar the mare having，by this means，both her prefeat and future foal to wourih，her ability is divided，and noe cannot fupply both fo largely as the might ene only．It would therefore be better，in order to have cxeelitent horfes，to lat the mares be covered only evely other year；they wondd lat the longer，and bring foals more ecrainly：for，in common thuds，it is fofar from loeing tue that all mares which have been covered bring colts every year，that it is conlidered
as a fortunate circumftance if half or at moll $t \times 0$ thirds of them foal.

Mares, when pregnant, will admit of copulation; but it is never attended with any fuperfoctation. They ufually breed till they are 14 or 15 years of age; and the molt vigorous till they are above 18 . Stallions, when well managed, will engender till the age of 22 , and even beyond; but it mut be olferred, that fuch horfes as are foontll made thallions, are alfo the foonett incapable of generation: thus the large horfes, which acquire trength foonct than the flender, and are therefore often ufed as flallions as foon as they are four years oll, are incapable of generation before they are dixteen.

## Geliding of Morsfs. Sec Gerding. <br> Rearing of Horses. Sec Colt.

Drarghe-Hokse, in farming, a fort of coarfemase hurfe deflined for the fervice of the cart or piough. In the choice of thefe horfes for what is calied the forw druugbt, they are to be chofen of an urdinary height; for otherwife, when put into the catt, one draws un. equally with the other. Thae drauglit-hor!'e thenald be large bodied and Atrong loined, and of fuch a difpo. fition, as rather to be coo dull than too brikk, and ra. ther to crave the whip than to draw noore than is need. ful. Mares are the bitelt for this ufe for the farmer, as they will be kept cheap, and not only do the work, but be kept breeding, and give a yearly increafe of a foal. They thould have a goud head, neck, breall, and nooulders; for the rett of the thape, it is not of much confequence. Only, for breeding, the mare thould have a large belly; for the more room a foal has in the dam, the better proportioncd it wili be. Diaughthorfes fhould be always kept to that employ. Some put them to the faddle on occalian, but it does them great harm, alters their pace, and Spoils them for labour. The draught horfe ought to have a large hroad head, becaule horfes of this maped liead are leis fubiect than athers to difeafes of the eycs. The ears hould be fmall, flraight and upright; the notriis large and open, that he may treathe whin the mure freedon. A hevife with a full and bold eye always promites well. Onthe other hand, a funk eye and an elesated brew are bad figns. The horfe is eftemed filtef for this purpoie alfo, that has a large and round buttock, which neither finks down nor curs. He mail have a from and firong tail, and the dock mult be thick and well furnifhed wilh hair, and placed weither very ligh nor very lows. The legs fluuld be taiber fiat and broad than round : the roundnefs of the lear being a fath in a horfe deftined to labour that will foon ruin him. As to the hinder legs, the thighs fhould be flethy and long, and the whole mufcle which fhows iffelf on the outide of the thigh mould be large and veiy thek. IIo country can bring a parallel to the fize and ilrength of our horfes deftined fur the dranghe. In London there are inftances of fingle hories that are able to Craw on a plain, for a finall fpace, the weight of three tuns, and which can with eafe, and for cominuance, draw half that weight. The the k horfes of Yorkfinire ufually carry a burden of +20 b. wer the highell hills of the north, as well as the :n. in level wads: but the moft remarkable proof of whe trensll of our Britinh horfes is derived fiom that of our mid luotics; fume of which sitilat one load carly 13 natafutes, which at
a moderate computation of 70 lb . cach, with amount
to 910 lb . Nothing is fo enential to the health of
 thefe ferviceable creatures as cleaninesis; if they are fed ever fo will, and not kept clan, they will be fub. ject to numetous difeales.

Phe fervant who has the cate of them ought to be up very carly, and to clean the racks and nangers from ali falth." Tleceurrying of them ought we batefully performed uevy morning, but not in the table, for the dult to fall upon the other hories, as it is too ofern done. After the horfis are dufted, tl.cy fhe, wh 1 daily twith a whiip of Rraw hard up, and wetting it in water, rub the legs, moulders ant budy with it. Wany of the difeafes of draughe-horfer, which are not owing to nallitelis, are owing to bad water.; fach as are two raw, too muddy, or too cold, being all inproper. It there be any runaing fream in the neigh. Lounhood, they thould always be led to that to water cwery day in fummer, but in wister, well-water is narminh, and is better for them. If there be a neceffity of giving them well water in fumbit, it mull be drawn up forie hours before the time, and expufed to the linn-beams in tubs cr trumels; marfh-water or that of lowland dithes is wort of all. When the labouring torfe bas drank his water, he fhould have his oa:3 given him, and thefe mould be carcully fiffed, and the manger duted firit. It is a common praketie, as foun as a lorfe is corre in from hio work, to rub dosis his legs with a hard whifp of hay; but the bett judges of horfes abfolutely cordemn this, and obferve, that this rubbing of the legs after 1 ard labour brings down humours into them, and makes them $\mathfrak{l l i f f}$.

The rubbing itidf is wholefore, but the doing it when the creature is hot is the mifchief; wlike a horfe is in a fweat it is a great relief and reffeftment to him to have his body rubbed down, but when he is cold is the proper time to rub his legs. The racks are to be well fupplied with hay, and the horfs thould be left to rell and cat, about two hours, and then ked to wa. ucr; after this their oats hoold be given them, and they fould thengo to work agnin.

In the erening, when the labour if the day is over, the frit thing to be done is to examine the feet, and fee if any thing is ands about the those, and what eareh or gravel is lodged in the foot, between the thoe and the fule, is to be picked out and bane frefl cousoung pu: in its place, which will cued and re fiefor the part.

A very material thing for the prefervation of alfiorts of cattle, but of none to much as draught hories, is fiem and clean litter.

sorfe.
be totally clofed up, or the cranium in that part not be fo hard as the reft for fome years after. This opennefs is found to be increafed upon the child's catching cold. When the difeafe continues long, it is reputed a fign of weaknefs and mort life. In this cafe, it is ufual to rub the head now and then with warm rum or brandy, mixed with the white of an egg and palm-oil. Sometimes the diforder arifes from a collection of waters in the head called an bydrocephalus.

Stome-Horse. See Stallion.
Horse Tail. See Equisetum and Ephedra.
Horse Velch. See Hippocrepis.
$W^{\prime}$ ar-Horse. The proper rules for choofing a horfe for fervice in war, are thefe: he fhould be tall in itacure, with a comely head, and out-fwelling for clead. His eye fhould be bright and fparkling, and the white part of it covered by the eye brow. The cars fhould be fmall, thin, fhort, and pricking; or if long, they thould be moveable with eafe, and well carritd. The neek fhould be deep, and the breatt large and fwelling. The ribs bending, the chine broad and Atraight, and the buttocks round and full. The tail hould be high and broad, ncither too thick nor too thin; the thigh fiwelling; the leg broad and flat, and the paftern thort. When fuch a horfe is chofen, he mult be kept high duling the time of his teaching, that he may be full of vigour. His foodmuft be fweet hay, and good clean oats, or two parts of oats and one part of beans or peafe, well dried and hardened. The quantity fhould be half a peck in the morning, and the fame quantity at noon fond in the evening Upon his refting days he is to be dreffed between five and fix in the morning, and watered at feven or cight. In the evening he is to be dreffed at four, and watered about five, and he muft always have provender given him after watering; he muth be littered about eight, and then muft have food gi. ven him for all night. The night before he is ridden all his hay is to be taken away about nine o'clock, and lie null have a handful or two of oats about four in the morning: when he has eaten thefe, lee is to be urned :pon the fuafle, and rubbed very well with dry cloths; then faddled, and made fit for his exercile. When he has performed this, he is to be brought fweating into the Rable, and mbbed down with dry wifps. When this has been done, the faddle is to be taken off, and he is to be rubbed down with dry claths; the houfing cloth is then to be laid on; and the faddle being again laid on, he is to be walked gently ahout till theroughly cool. After this, he muft thand withwut meat two or three hours, then he mult be fed; and in the afternoon he is to be rutbed and dreffed as before, and watered in the ufual manuer.

Hokse Worm, in natural hiftory, a fpecies of flyworm called alfo tott, produced of eggs depolited by a two-winged fly of the flape and lize of the humble bee in the intellines of horfes. See Borts.

River-Horsf, in zoology. See Hippnpntamus.
Horse is allo ufed in the military language, to expruis the cavalry; or the body of foldiers who ferve on horfeback.

The horfe includes horfe guards, horfe grenadiers, and troopers. Dragoons are alfo frequently comprelicnded under this name, though they tight on foot: of hefe there are now 18 regiments; befides three re$N^{\circ} 157$.
nadier, Dragoons, and Guards.
Mafler of the Hoksf. See Master.
Light-Horsf, are regiments of cavalry, mounted on light fwift horfes, whofe men are fmall and lightly ac. coutred. They were firlt raifed in J 757 . The denomination arofe hence, that anciently they were lightly armed, in comparifon of the royal guards, which were armed at all points.

Hungarian Horse. See Hussars.
Horse is alfo a term ufed in various arts and manti. factories, for fomething that helps to futain their work from the ground, for the more conumodious working at it.

The horfe ufed by tanners and fikinners, alfo called the leg, is a piece of wood cut hollow and roundifl, four or Give feet long, and placed anlope; upon which they pare their kins to get off the dirt, hair, flefh, \&c.

Horse is allo ufed in carpentry, for a piece of wood jointed acrofs two other perpendicular ones. to futtais the boards, planks, \&c. which make bridges over fmall rivers; and on divers other occafions.

Horse, in fea language, is the name of a rope reaching from the middle of a yard to it extremity, or what is called the yard-arm, and depending about two or three feet under the yard, for the failors to tread upon whilf they are loofing. reefing, or furling the fails, rigging out the ftudding fail booms, \&c. In order, there. fore, to keep the horfe more parallel to the yard, it is ufually fufpended to it at proper diftances, by certain ropes called ftirrups, which hang about two feet under the yard, having an eye in their lower ends through which the horfe paffes.

Horse is alfo a thick rope, extended in a perpendicular direction near the fore or after-lide of a malt, for the purpofe of hoilting or extending forme fail upon it. When it is fixed before a mall, it is calculated for the ufe of a fail called the fquare fail, whofe yard being attached to the horfe, by means of a traveller or bull's eye, which nides np and down occalionally, is retained in a fleady polition; either when the fail is fet, or whilf it is hoilling or lowering. When the horfe is placed abaft or behind a matt, it is intended for the try-fail of a fnow, and is accordingly very rarely fixed in this pofition, except in thofe floops of war which necafionally aflume the form of fnows, in order to deceive the enemy.

Horse is alfo a cant name introduced into the management of lotteries, for the chance or benefit of a ticket or number for one or more days, upon condition, if it be drawn a prize within the time covenanted for, of returning to the feller an undrawn ticket.- $\%$ determine the value of a horle; multiply the amount of the prizes in the lotery by the time the horfe is hired for: and from the prodit fubtract the amount of the number of prizes by the value of an undrawn ticket into the time of the horfe: the remainder being divided by the number of tickets into the whole time of drawing, the quotient is the value of the horfe. See

## Lottery.

## Horsf-Bread. See Bitead.

Horse. Dung, in gardening, is of great ufe in making hot-beds, for the railing all forts of eandy crops; as fallading, cucumbers, milons, afparagus, \&c. for
whlch parpofes no other kinds of dung will do fo well. Horle dung ferments the ftrongef: and if moxed with litter and fea-coal athes in a due proportion, will continue its heat much longer than any other fort of dung whatfocver: and afterward, when rotiod beemes an excellent manure for molt forts of lanel; more efpecially for fuch as are of a cold nature. Furfliff clayey land horfe cung mixed with fea-coal aftes, and the cleanting of ftreets, will catife diee paits to feparate - much fuoner than any onleer compolt: fo that where it can be ubtained in plenty, it is always to be resom:mended for fuch lands. See Dune.

## $\begin{array}{llllllllllll}H & O & R & S & E & M & A & N & S & I & P ;\end{array}$

 Or, The Art of Riding, and of Training and Managing, Horses.of Sect. I. The Method of prefaring Horfes to be mounted.

THOUGH all horfes are generally bought at an age when they have already been backed, they Should be begun and prepared fior the rider with the fame care, genilenefo, and caution, as if they had never been handled of backed, in order to prevent accidents, which might elfe auife from feittithnefs or other caufes: and as it is proper that they thould be taught the figure of the ground they are to go upon when they are at firll mounted, they fhould be previoully trotted in a longe on circles, without any one upon them.

The manner of doing this is $2 s$ follows: Put an eafy cavefion upon the horfe's tofe, and make him go forwards round you, flatiding quiet and holding the longe; and ketanother man, if you find it peceffary, folluw him with a whip. All this mut be done very genty, and but a little at a time: fore mure horles are fpoiled by owermuch wowk, than by any wher treatment whatever: and that by very conirary effects; for fomerimes it drives them into rice. madnefr, and defpair, and uften itupitice and totally difpirits them.

The firfe ohedience required in a horfe is geing forwards; till be perform this duty freely, never even think of making hem reliu back, which would inevitably make hime reflive: a focn as be gees fonvards readily, tlop and carefs hun. You mult rem-mber in this, and likewife in every ofler exercife, to wie him so go equally well to the right and left; and wh n he obeys, carfo bom and difmifs him immediat ly. If a horfe that is very sung taker fright and tamis Nill. Jead on another liurice vetore lum, which pruh . Oly will induce him inflantly to follow. Put a faiffe in his mouth: and when lie eques treely, fadd'e hime, zirting hin at fisll very loofe. Lett the cond, winich you hold, be long and loofe: but nut fo miuch fo as to endanger the horf's ertangling his leers in it. It mule be olferved, that farall cincies, in the lagiuning, would conflrain the burfe too much, and put him upion defendiug himefle. Nobend nofl be sequired at bir!: never fulfer him to gallop talfo; but whenever he attempts it, fop him without delay, and then fet him off aftelh. If he gatloys of his wan accold. and true, permit him to continue it; but if be does it not velua-
tarily, do not demand it of him at firf. Should he of ptreines fly and jump, thake the cord gently upon his nofe rithou jerking it, and he will fall into tis trot again. It he ftands thil, plunges, or rears, let the man who holds the whip make a noife with it ; but never touch him till it be abfulutely neceffary to make him go on. When you change liands, llop an! caref; him, and entice him by fair meeans to come up to you: for by prefenting yourfelf, as form- $d$, on a fuiden before harfes, and 'frightening them tos the otler fife, you run a great rific of iving them a fhenefs If the keeps his head too low, thake the careffon to make him raite it ; and in whatever the holfe does. whether he walks, tro:s, or gallops, let it be a confanir rolle, that the motion be determined. and really fuch as is intendec, without the leath fhufling, pacing, or any uther irregular gait.

## Sect II The Method of placing the Rilor ant  coffonal laftruations lor Niders and the Hirjes.

IT is neceffary that the greveft attention, and the fame gentenefs that is ufed tin seaching the hores, be obferved likewife in teachine the rider, efponally at the beginning. Every mothod and att mull be practifed to crate and preferse, both in man and horfe, all puffible feeling and ventibilny: contrary to the ufage of molt riding-maters who feem induth rinuly t. hbour at abolifhing thefe principles hoth in th. .ne and the ofher. As fo many eflititial points finend upon the manner in which a $m_{\text {til }}$ is at finfl plich! on horfehack, it ought tos be confidered and attended to with the ftri tefl care and exactnefs.

The abfurd ly of putting a man, who perthap, has never before been upun a horfe, on a romash trunting horfe, on which he is obliged to Aick with all the force of his arms and lese, is tno obvius to need mentioning. This sough work, all at once, is plain'y as detrimental at firt, as it is excellent afterwards in proper time. No man can be cither well or frim'y feated on horfeback, unlefs he be mater of the balance of his body, quite unconftained with a full poffelion of himfelf, and at his eafe: none of a hich requitites can he enioy, if his atiention be wherwife enzaged: as it mult wholly be in a raw, unfuppled, aad un-

Diplacirg the Ricur. propardlach, who is put at once upon a rough horft ; in furin a diftefsful fate, he is forced to keep himferf on at any rate, by holding to the bridle (at the oxPence of the feabibity beth of his own hand and the horfe's month), and by clinging with his legs, in denser of his life, and to the eertain depravation of a right fecling in the horfe.

The firt sime a man is put on horfehack, it cught to be upon a very gentle oue. He never hould be made to tre:, till he is quite eafy in the walk; nor callop, till he is able co trot properly. The fame munt he wifersed in regard to horfes; they hould neser be made to trot till they are obedient, and their mouths are well formed on a walk, nor be made to gallop, till the fame be effected on a trot. When he is arrived at fuch a degree of firmnees in his feat, the more he trote, and the more he rides rough horfes, the better. This is not only the bett method, but alfo the eafief ard the thorteft: by it a man is foon made fuff. cientiy an horfeman for a foldier: but by the other detetable methods that are commonly ufed, a man, inftead of improving, contracts all forts of bad hab:r, and rides worfe and worfe every day; the horfe too becomes daily more and more unfit for ufe. In procceding according to the manner propofed, a man is rendered firm and ealy upon the horfe, both his own and the horfe's fenfibility is preferved, and each in a fituation fit to receive and practife all lefions effectually.

Among the various methods that are ufed of piacing people on hofflack, few are dirceted by reafon. Eefore you let the man mount, teach him to know, and always to examinc, if the curb be well placed, (that is, when the horfe lias a bit in his mouth, which at firt he fhe uld not; but only a fnaffle, till the rider is firm in his feat, and the horfe alfo (omewhat taught): likewife to know if the nofe band be properly tight; the throat-band loofim; and the mouth piece neither too ligh nor too low in the horfe's mouth, but rightly put fo as not to wrinkle the flkin nor to hang lax; the girts drawn moderately, but not too tight : and the crupper and the breat-plate propetly adjuted. A very good and carcfut hand may venturc on a bit at fift, and fucceed with it full as wall as hy beginning with a fanfle alrne; only coits, indeed, it is better, in all fchools whatforet, to avoid any prefiure on the bars jut at bift, which a cubb, though ever fo delicately ufed, muit in fome degree occation. Whien the bridle, \&c. have been well looked to, let the man approach the horfe gently near the thoulder; then taking the reins and an handful of the mane in his left hand, let him pat his foot fofely in the deft thirup, hy pulling it towards him, let he touch the horfe with Lis toe; then railing himfelf up, let him relt a moment on it whith his bedy upight, but not Ilif; and after that, pafing his right leg elear ovct the faddle without nobling againt any thing, let lim foat himielf gently down. He mun be cautious not to take the reins too Mort, fer fear of making the horfe rear, run, or fall back, or lhrow up his head; lout let him huld them of an equad length, neither tight nor flack, and with the little firger betwixt them. It is fit that horfes hould be accuffomed to fand fill to be mounted, and not to An will the rider fleaies. All foldiers frould be in.

Arructed to mount and difmouns equally well on both of pl fides, which may be of great ufe in times of hurry and the $t$ confurion. Then place the man in his faddle, with his body rather back, and his head held up with eafe, without fliffuefs; feated neither forwards, nor very backwards; with the breaft pulhed ont a lictle, and the lower part of the body likewife a little furwards; the thighs and legs turned in without conftraint, and the feet in aftraight line, neither turned in nor nut. By this pofition, the natural weinht of the thighs has a proper and fufficient preflure of iffelf, and the legs are in readinets to att when called upon: they muft hang down eafy and naturally; and be fo placed, as not to be wriggling about, touching, and tickling, the horfes fites, but always near them in cafe they flould be wanted, as well as the heels.

The body mrit be carefully kept eafy and firm, and without any rocking when in motion: which is a bad habit very eafly contracted, efpecially in galloping. The ift elbow mun be gently leant againft the body, a little forwards: unlefs it be fo refted, the hand cañnot be fleady, but will ahways be checking, and confequently have pernicinas effects on the horfe's mouth. And the hand ought to be of equal height with the elbow ; if it were lower, it would conftrain and confine the motion of the horfe's thoulders: but, as the moutbs of horfes are different, the place of the hand alfo mul occafionally differ: a leaning, low, heavy, fore-hand, requires a high hand; and a horie that pokes out his nofe, a low one. The right-hand arm mult be placed in fymmetry with the left; only let the right hand be a little forwarder or backwarder, higher or lower, as occations may require, in order tha: both hands niay be frce; both arms muft be a little bent at the eibow, to prevent Alifnefs.

A foldier's right hand foould be kept unemployed in riding; it carries the ford, which is a fuficient bufinefs for it .

There remains one farther obfervation, that ought not to be omitted, about the hand, that it mult be kept clear of the body ; $\therefore$ e. about two inches and a half forwards from it, with the nails turned oppofite to the belly, and the writt a little rounded with eafe; a pofition not lefs gracefal than ready for flackening, tightoning, and moving the reins from one fide to the other, as may be fomad necoflary.

When the nen are well pheced, the more rough trotting thicy have without Alirrups the better; but with a thict care always, that their polition be preferved wery exacitly. In all cafes, preat care muft be taken to hirder their clinging with their legs: in Thort, no fticking hy hands or legs is ever to be allowed of at any time. If the motion of the horfe be too rough, llacken it, till the rider grows by degrees more firm : and when he is quite firm and eafy on his horfe in every kind of motion, Atirrups may be given. him : but he mut never leave off trotting of en without any.

The firrups muf he neither fhort ner long; but of fuch a length, that when the rider, being well placed, puts his feet into them (about one third of the length of each foot from the point of it), the points may be between two and three inches higher than the heels. The rider mult not bear upon his ftirrups, but only.
?ions let the natural weight of his legs reft on them : For ning if he bears upon tbem he would be raifed above and out of his faddle; which hould never be, except in charging fword in hand, with the body inclined forwards at the very inftant of attacking. Spurs may be given as foon as the rider is grown familiar with ftirrups; or even long before, if his legs are well placed.

A hand fonold always be firm, but delicate: a horfe's mouth fould never be furprifed by any fudden tranfition of it, either from flack to tight, or from tight to flack. Every thing in horfemanflip muft be effeted by degrees, but at the fame time with fpirit and refolution. That hand which, by giving and taking properly, gains its point with the leall force, is the beft; and the horfe's mouth, under this fame hand's directions, will alfo confequently be the beft, fuppoling equal advantages in both from nature. This principle of gentlenefs thould be obferved upon all occafions in every branch of horfemaulip. Sonctimes the right hand may be neceffary, upon fome trouble. fome borfes, to affift the left: but the feldomer this is done, the better; efpecially in a foldier, who has a fiword to carry, and to make ufe of.

The fnafle muft on all occafions be uppermoft; that is to fay, the reins of it mult be above thofe of the bridle, whether the fnaffe or the bit be ufed feparately, or whether they be both ufed together. When the rider knows enough. and the horfe is fulficiently prepared and fettled to begin any work towards fuppling, one rein muft be flortened according to the fide worked to ; but it muft never be fo much floortened, as to make the whole ftrength refl on that rein alone: for, not to mention that the work would be falfe and bad, one fide of the horfe's mouth w...uld by that means be always deadened; whereas, on the contrary. it thould always be kept fiefh by its own play, and by the help of the oppofite rein's acting delicately in a fomewhat fmaller degree of tenfion; the joint effect of which produces in a horfe's mouth the proper, gentle, and eafy, degree of appui or bearing.

A coward and a madman make alike bad riders, and are both alike difcosered and confounded by the fuperior fenfe of the creature they are mounted upon, who is equally fpoilt by both, though in very different ways. The coward, by fulfering the animal to bave his own way, not only confrms lim in his bad labits, but creates new oftes in him: and the madman. by falfe and violent motions and corrections, drises the horfe, through defpair, into every bad and vicious trick that rage can fuge elt.

It is very requifite in horfemanthip, that the hand and legs fhould act in correfpondence with each other in cvery thing; the latter always fubfervient and affiftant to the former. Upon circles, in walking, trotting, or galloping, the outward leg is the only one to be ufed, and that only for a moment at a time, in order io fee off the horfe true, or put him rigbt if he be falfe; and as foon as that is done, it muft be taken away agais immediately: but if the borfe be lazy, or otherwife retains himfelf, both legs mult be ufed and preffed to his fides at the fame time together. The lefs the legs are ufed in igeneral, the better. Very delicate
good riders, with horfes they have dreffed themflece, infrusions will fcarcely ever want their help. By the term out. concerming quard is underttood the lide which is more remute from the centre; and by insuard is meant the fide next to the centre. In reiniag back, the rider hould be careful not to ufe his legi, wilets the horfe backeth on his thoulders; in which cafe they mut be both applied gently at the fame time, and correfpond with the liand. If the horfe refufe to back at all, the rider's legs mut be gently approached, till the horle lifts up a leg. as if to go forwards; at which time, when that leg is in the air, the rein of the fame fide with that leg which is lifted up, will catily bring that fame leg backwards, and accordingly oblige the horfe to back; but if the horfe offers to rear, the legs mult be inflavtiy removed away. The inward rein mult be tighter on cireles, fo that the horfe may bend and look inwards; and the outward one crofed over a little towards it; and both beld in the lefe hand.

Let the man and horfe begin on very flow motions, that they may have time to underikand and reflect on what is taught them; and in proportion as the effeetz of the reins are better compretended, and the manuer of working becomes inore familiar, the quicknefs of motion mutl be increaled. Every rider mull lean to fcel, without the help of the eye, whea a horfe goes falfe, and remedy the fault accordingly: this is an intulligence, which nothing but practice, application, and attention, can give, in the beginning on flow motions. A horfe inay not only gatlop falfe, but alfo trot and waik falfe. If a horfe gallops faife, that is to fay, if going to the right he leads with the left leg, or if going to the left he leads with the right; or in cafe he is difunited. i.e. if he leads with the opponte leg behind to that which he leads with before; Aop him immediately, and put him off again properly. The method of effecting this, is by approaching your outward leg, and putting your hand outwards; till keeping the iuward rein the fhorter, and the horfe's head inwards, if poffible: and if he fould titl refitt, then bend and pull his head outwards alfo; but replace it again, bent properly inwards, the moment he goes off true. A horfe is faid to be difunited to the tight, when going to the right, and confequently leading with the right leg before, he leads with the left behind: and is liad to be difunited to the left, when going to the left, and coniequently leading with the left leg before, he leads with the right behind. A horfe may at the fame time be bath falfe and difunited; in correcting both which faults, the fame method mull be ufed. He is both falfe and difunited to the right, when in going to the right he leads with the left leg before, and the right behind; notwithttanding that hinder leg be with propriety mure forward under his belly than the left, becaufe the horfe is working to the right: And he in falle and difunited to the left, when in going to the left he leads with the right leg before and the left behind; notwithtanding, as above, that hinder leg be with propricty more forward under his belly than the right, becaufe the horfe is working to the left.

In teaching men a right feat on horfeback, the greatell attention mull be given to prevent Riffnefs, and fiticking by force in any manner upon any occa$4 \mathrm{O}=$
tooh Man and Horlc.
of fipprinn fion: Athnefs difgraces every right work; and fickinwite ing ferwes only to throw a man (when dilplaced) a great ditance from his horfe by the fpring he mult ro If with: whereas, by a proper equiliorating polizion of the body, and by the na:ural weight only of the thighs, he eamot hit be firm and fecure in his feat.

As the men become mure liem, and the horles more furpilk, it is proper to nake the cireles lels; but not fou anch fo. For far of throwing the horles furwards dipon thei houlders.

Suak horfes, when firf the bit is put into their mumeths, if prat care be not taken, will put their heads bery low. With fuch horfes, raife your night hand with the bridon in it, and play at the fame cime with the bit in the left hand, giving and taking.

Oa circks, the rider mull lean his bondy inwards; wulefo great ateation be given to make han do it, he will be perpetually koling his feat outwards. It is fearce poffible for him to be difplaced, if he leans his Dody properly inwards.

SEct. lli. The Nothod of fuppling ITorfes witio Men aton them, by the Epauie en dedans, oc. wilh and without a Longe, on Circles andon firaight Lines.
Wren a harfe is well prepared and fettled in all bis motioris, and the rider firm, it will be proper then to proceed on towards a farther fuppling and teaching of both.

In letting out upon this new work, begin by bring. ing the horfe's head a little more inwards than before, palling the inward rein genty to gou by degrees. When this is done, try to rain a little on the houlders, by keeping the inward rein the horter, as before, and the ontward one crofled over towards the inward one. The intention of thefe operations is this: The inward rein ferves to bring in the head, and procures the bend; whilft the outward one, that is a little croffed, tends to make that bend perpendicular, and as it hould be, that is to fay, to reduce the nofe and the forehead to be in a perpendicular line with each other: it alfo ferves, if put forwards, as well as alfo cruffed, to put the horfe furwards, if found neceffary; which is often requifite, many horfes being apt in this and other works rather to lofe their ground backwards than otherwife, when they hould rather advance; if the nofe were drawn in towards the brealt beyond the perpendicular, it would connine the motion of the fhoulders, and have other bad effects. All other bends, befides what are above feecified, are falie. The ontward rein, being croffed, not in a forward fenfe, but rather a little backwards, ferves alio to prevent the ontward thoulder from getcing too forwards, and makes it approach the inward one; which facilitates the inward leg's croffin over the outward one, which is the motion that fo admirably fupples the fhoulders. Care mut be taken, that the inward leg pafs over the outward one, without touching it: this inward leg's crofing over mult be helped allo by the inward rein, which you mull crofs towards and over the outward rein evcry time the outward leg comes to the ground, in order to lift and help the inward leg over it: at any other time, but juf when the outward leg comes to the ground, it would be wrong to crofs the inward
rein, or to attempt to lift up the inward leg be it; nay, it would be demanding an abfoluse impolfobity, and lugging about the reins and horfe to no oup lie: brecufe in this cafe, a very great pht of the horfe's weight eeiting then upon that deg, wouhd render fueh an attempt not only fruilefs, but alf, prejudicial to the fulubility of the mon:h, and probably oblige him to defen l himfelf: and, moreover, it would pu: the horfu under a neeeflity of itraddhug lefinee, and alfo of leading with the wrong leg, without bein froductive of any fappling motion whatfover.

When the hore as thas tar faxailionly accumomed to what you have required of him, then proced to effest by degrecs the rame crolfag in his hader legs By bringing in the fore legs mote, you will of cuarfe en. gage the hin ler ones in the fame work: if they refil, the fider mu'l b ing both reins more inwards; and, if necelfary, pue back alfo, and approach his inward leg to the horfe; and if the horfe throws ont his croup too sar, the rider mull bring botl: reins outwards, and, if abfolutely neceflary, he nunt allo make ufe of his out wasd leg, in order to replace the horfe properly: obferving that the croup thould always be conliderably be hind the thoulders, which in all attions muit go fird: and the moment that the korfe obeys, the rider mutt put his hand axd leg again in their ufual poftion.

Nothing is more ungraceful in itfelf: more detrimen. tal to a man's feat, or more deitructive of the fenfizility of a horfe's fides, than a continual wrigeling unfettlednefs in a horfoman's legs, which prevents the horfe fiom ever going a moment together true, theady, or determined.

A horfe flould never be turned, withont firft moving a dep forwards: and when it is doing, the rider mut not lift his elbow, and difplace himfelf; a motion only of the hand from the one lide to the other being fuffia cient for that purpofe. It mutt alfo be a conflant rule, never to fuffer a horfe to be ltopped, mounted, or difmounted, but when he is well placed. The flower the motions are when a man or horfe is taught any thing. the better.

At lirlt, the figures worked upon mult be great, and afterwards made lefs by degrees, according to the improvement which the man and horfe make; and the cadenced pace ahio, which they work in, muit be aecordingly augmented. The changes from one fide to the other, matt be in a bold determined trot, and at firft quite ftraight forwards, without demanding any fid motion on two piffes, which is very neceflary to require afterwards when the horfe is fufficiently. fuppled. By two piffes is meant, when the fore-parta and hinder parts do not follow, but deferibe two different lines.

In the beginning, a longe is ufful on circles, and alfo on Araight lines, to help both the rider and the hurfe; but afterwards, when they are grown more intelligent, they fhould go alone. At the end of the leffon, rein back; then put the horfe, by a little at a time, forwards, by approaching both legs gently to his fides, and playing with the bridle: if he rears. pufh him out immediately into a full trot. Shaking the cavefon on the horfe's nofe, and alfo putting one's felf before him and rather near to him, will generally make him back, though lee otherwife retufe to do it: and morever a digh: ufe and approaching of the e" rider's
id colegs, will fornetimes be neceffary in backing, in order to prevent the horfe from doing it too much upon his Thoulders; but the preflure of the legs ought to be very fimall, and taken quite away the mement that he puts hiunfelf enough nopon his bannches. If the lurfe dues not back upot. a llraight line properly, the rider muft not be permitted to bave recourfe immediately to his leg, and fo dillort himfelf by it ; but lifftry, if croffing over his hand and reins to which ever fide may be neceflary, will not be alone fufficient: which molt frequently it will: :if rot, then employ the leg.

Aficr a horfe is well prepared and fetted, and goes freely on inall tis feveral paces, he ought to be in all his works kept, to a propur degree, upon his haunches, with his hindur legs well placed under him; whereby he will be always pleafant to himflelf and this rider, will be light in hand, and ready to execute whatever may be demanded of him, with facility, rigour, and quicknefs.

The comman method that is ufed, of furcing a horfe fidewife, is a mofl glaring alofurdity, and very hurtful to the animal in its comfequences; for intead of fup. pling him, it obliges him to thfien and defend limfelf, and often makes a creature that is naturally benerolent, refive, frightened, and vicious.

For horfes, wbo have very long and bigh fore-hands. and who poke out their noles, a running fnaffe is of excellent ufe; but for fuch as hare and keep their heads low, a common one is preferable; though any horfe's head indeed may be kept up alfo with a running one, by the rider's keeping his lands very high and forwards: but whenever either is ufed alune without a bridle upon horfes that carry their heads low and that boie, it mult be fawed about from one lide to the other.

This leffon of the epasle en dedans fhould be taught to fuch people as are likely to become ufeful in heclp. ing to teach men and to break horfes; and the nore of. fuch that can be found the betier: none others fluuld ever be fuffered upon any occafion to let their horfes look any way befides the way they are going. But all bolfes whatever, as likewife all men who are defigned for the teaching others, muft go thoroughly and perfeetly through this excellent leffon, under the dirteticns of intelligent inftructors, and often practife it too afterwards; and when that is done, proceed to and befinithed by the leffons of bead and tail to the wall.

## Sect.IV. Of the Hoad to the Wall, and of the Croup to the Wall.

This leffon flould be practifed inmediately after that of the efoule en dedians, in order to place the horfe properly the way he goes, \&c. The difference between the head to the wall, and the croup to the wall, con filts in this: in the former, the fore parts are more remote from the centre, and go over more ground ; in the latter, the hinder pats are more remote from the centre, and confequerily go over more ground: in both, as likewife in all other lefons, the fhoulders mult go firtt. In riding horfes, the head to the wall is the eafier leffon of the two at firtt, the line to be worked upon being marked by the wall, not far from bis head.

The mation of the legs to the right, is the fame as of Head to that of the cpoule en dedans to the left, and fo vice verfor the Wiall, but the head is always bent and turned differently: in ac the epoulde en dechans, the harfe looks the contrary way to that which he goes; in this, he looks the way he is going

In the beginning, very litule bend mult be required; tno much dt once would aftomith the horfe, and make hin clefend himelf: it is to be dugmented by degrees. If the horfe alfulutely refufes to ubey, it is a fign that cither loe or his nider has not been tufferently prepared by previous leffons. It may tadpen, that weaknefs or a hure in fome patt of the body, or fometines temper, though feldom, may be the caute of the horfe's defending himfelf: it is the rifer's bubinefs to find out from whence the obftacle arifes; and if he finds it to be from the firt mentioned calle, the previous kelfons mut be refumed again for fome tine; if from the fecond, proper remedies muft be applied; and if from the lait caufe, when all fair mean, that can be tried have failed. proper corrections with coolnefs and judg. ment muta be afed.

In practiging this leffon to the rigit, bend the horfe so the right with the right rein; helping the left leg over the right (at the time when the right leg is juit come to the ground), with the left rein crufed towards the right, and kecping the right houlder back with the right rein towards your body, in order to facilitate the left leg's croffing over the right; and for likewife vice verfor to the left, each rein helping the other by their properiy mixed tflects. In working to the right the rides's left leg helps the hinder-patts on to the right, and his right leg ftops them if they get too forwards; and fo viez verfa to the left : but neticher ought to he wfed, till tle inand being employed in a proper manner has falled, or finds that a greate: force is neceffary to bring about what is required than it can eftect alone: for the legs fould not only be correfponding with, but alio hubfervient to, the hand; and all unnccefiary aids, as well as all foree, ought always to be avoided as much as poffible.

In the execution of all leffons, the equiline of the rider's body is of great uie to the horfe: it ought always to go with and accompany every motion of the animal; when to the rigbt, to the right; and when to the left, to the left.

Upon all horfes, in every leffon and action, it mut be obferved, that there is no horie but has his own peculiar appui or degree of bearing, and alfo a fentin bility of mouth, as likewife a rate of his own, which it is abfolutely neceflary for the rider to difcover and make himfelf anquainted with. A bad rider alwaye takes off at leat the delicacy of both, if not abfolutely dettroys it. The horic will infurm his rider when he has got his proper bearing in the mouth, by playing pleafantly and fteadily with his bit, and by the fray, about his chaps. it delicate and good hand will not only always preferve a light appui, or hearing, in its fenfibility: but alfo of a heavy one, whether maturally fo or acquired, make a light one. The lighter this appui can be made, the better ; provided that the ridea's hand correfponds with it ; if it does not, the more the horfe is properly prepared, fo much the worfe. Intances of this inconvenience of the bett ot
11.f64 frand fire, \& c .

To make appuis, when the rider is not cqually taught with the horfe, inay be feen every day in fome gentlemen, who try to get their horfes bittol as they call it, without being fuitably prepared themfelves for riding them : the confequence of which is, that they ride in danger of breakies their necks; till at length, after much hauling about, and lyy the joint infenfibility and ignorance of themfelves and their grooms, the poor animals gradually become mere fenfelefs unfeelin $r$ ports; and thereby grow, what they call, fottlet. When the proper appui is found, and made of courfe as light as poffible, it mult not be kept duly fixed without any variation, but be played with; otherwife one equallycontinued tenfion of reins would render both the rider's hand and the horfe's mouth very dull. The flightent and frequent giving and taking is therefore neccflary to keep both perfect.

Whatever pace or cegree of quicknefs you work in, be it ever fo fatt, or ever follow), it mult be cadenced; time is as neceffary for an horleman as for a mutician.

This leffon of the had and of the tail to the wall. mult be tanght every foldier: fearce any manceuvere can be wall performed without it. In clofing and opening of files, it is almolt every moment wanted.

## Sect. V. The Metbod of making Horfes fand Fire, Ǹjifes, Alarms, Sights, sic.

Iy order to make horfes fland fire, the found of drums, and all forts of diferent noifes, you muft nfe them to it by degrees in the flable at feedine time; and inftead of being frightened at it, they will foon come to like it as a firnal for cating.

With regard to fuch horfes as are afraid of burning objects, begin by keeping them ftill at a certain difance from fome lighted fraw: carefs the horfe; and in proportion as his fright diminifhes, approach gradually the burning fraw very gently, and increafe the fize of it. By this means he will very quickly be brought to be fo familiar with it, as to walk undaunted even through it.

As to horfes that are apt to lie down in the water, if animatins thers, and atracking them vigoroufly, ficuld fail of the defired effect, then break a traw b wle full of water upn their heads, and let the water sun into their eare, which is a thing they apprethend very much.

All tronp horfes mult be taughe to fand quiet and Aill when they are thot off from. to itop the moment you prefent, and not to move after fining till they are required to do it; this leffon ought efocially to be obf wed in li, he troops: in fhort, the horfes muft be tanstit to he in cool and unditumbed, as to fuffer the riow to ate upon him with the fame freedom as if he was on foot Patience, coolnefs, and temper, are the on'y meatis requifice for accomplifhing this end. Begin $\mathrm{b}_{\mathrm{y}}$ wallong the horfe gently, then flop and keep hin from Atrting for fome time, fo as to accuftom him hy degrees not to liave the leaft idea of moving without oricers: if the does, then back him; and when youfop, him, and he is quite Aill, leave the reins guite loofe.

To ufe a loorfe to fire-arms, firft put a piftol or a carabine in the manger with his feed; then ufe him to the found of the lock and the pan; after which,
when you are upon him, fhow the piece to him, pre. To ma feuting it forwards, fotnetimes on one fide, fometimes Horic on the other: when he is thus far reconciled, proceed to Hafh in the pan ; after which, put a fmall charge into the piece, and fo continue augnenting it by degrees to the quartity which is commonly urfed: if he feems uneafy, walk him forward a few fleps flowly; and then flop, back, and carefs him. Horfes are often alfo difquieted and unfleady at the clafh, and drawing, and returning of fwords; all which they mult be famitiarized to by little and little, by frequency and gentenefs.

It is very expedient for all cavalry in general, but particularly for light cavalry, that their horfes fhould be very ready and expert in leaping over ditches, hedges, gates, \&c The leaps, of whatever fort threy are, which the horfes are brought to in the beginning, ought to be very fmall ones; the riders mull keep their bodies back, raife their hands a litule in order to help the fore-parts of the horfe up, and be very attentive to their equilibre. It is beft to begin at a low bar covered with furze, which pricking the horfe's legs, if he does not raife himfelf fulficiently, prevents his contracting a fluggith and dangerous habit of touching, as he goes over, which any thing yielding and not pricking would give him a cuftom of doing. Let the ditches you firft bring horfes to be narrow; and in this, as in every thing elfe, let the increafe be made by degrees. Accultom them to come up to every thing which they are to leap over, and to iland coolly at it for fome time; and then to raife themfelses gently up in order io form to themfelves an idea of the diftance. When they leap well Atanding, then ufe then to walk gently up to the leap, and to go over it without firt halting at it ; and after that pratice is familiar to them, repeat the like in a gentle trot, and fo by degrees father and fatter, till at leagth it is as familiar to them to leap flying on a full gallop as any other way : all which is to be acquired with great facility by calm and foft means, without any hurry

As horfes are naturally apt to be frightened at the fight and fmell of dead horfes, it is advifable to habituate them to walk over and leap over carcafes of dead hories: and as they are particularly terrified at this fight, the greater gentlenefs ought confuquently to be uled.

Horfes fhould alfo be accuftomed to fwim, whick often may be neceflary upon fervice; and if the men and horfes both are not ufed to it, buth may be frequently liable to perifh in the water. A very fmall portion of Arength is fulficient to guide a horfe, anywhere indeed, but particularly in the water, where they muft be permitted to have their heads, and be ao-ways conflrained in any fhape.

The unreafonable rage in Britain of cutting off all extremities from horfes, is in all cafes a very pernicious cuttom. It is particularly fo in regard to a troophoufe's tail. It is almolt incredible, how much they fuffer at the picket for want of it : conflantly fretting, and fweating, kicking, abour and laming one another, tormented, and duug off their meat, muterable, and helplefs; whilith other horfes, with their tails on, brufh off all flies, are cool and at their eafe, and mend daily; whilt the durked ones grow every hour more and more out of condition.

Sect. VT. The Method of reinirg back, -and if moving forwards immediately ofter; 一of Piaf. ing,-if Pillars, \&c.
Nexfr finifh your work by reining back wih hor. fce that have any difpofition towards retaining them. felves; but always move them furwards, and a litte upon the haunches alfo, after it, before you difmount, funlefo they retain themfelves very mach indeed, in which cafe nothing at all mult be demanded frem the haunches). This leffon of wining back, and piafing, is excellent to conclude with, and puts an horfe wetl and properly on the hanches: It may be doric, according as horfes are more or lefs fuppled, cither going forwards, backing, or in the farme place: if it is done well advancing, or at mofl on the fame fpot, it is full fufficient for a foldice's horfe: For to piafe in backing, is rather too much to be expected in the hurry which cannot but attend fuech numbers both of men and horfes as malt be taught together in regiments. This leffon inuif never be attempted at all, till horfes are very well fuppled, and fumewhat accuftomed to be put together; otherwife it will have very bad confequences, and create retlivencfs. If they refufe to back, and fland motionlefs, the rider's legs mull be approached with the greatell gentenefs to the horfe's fides; at the fame time that the hand is acing on the reins to fulicit the horfe's backing. This feldom fails of procuring the defired effect, by railing one of the horfe's fore-legs, which being in the air, has no wright upon it, and is confequently very eafily brought backwards by a fmall diegree of tenfion in the reins. When this leffon is well performed, it is very noble and uffeil, and has a pleafing air; it is an excellent one to begin teaching fchoiars with.

The lefon is particularly ferviceable in the pillars, for placing fcholars well at firts. Very few regimental riding-houfes have pillars, and it is fortunate they have not: for though, when properly made ufe of with fkill, they are one of the greatelt ard ben difooveries in horfomanthip: they mute be allowed to be very dangerous and pernicions, when they are not under the direction of a very knowing perfon.
Sect. Vil. The Mcthod of curing Reffivencfes, Viccs, Defences, Starting, \&c.
Wiachever a horfe makes refilance, one ought, before remedy or correction is thought of, io examine very minutely all the tackle about him, if any thing hurts or tickles him, whether he has any natural of accidental weaknefs, or in thort any the leaft inpediment in any part. For want of this precaution, many fatal difaters happen: the poor dumb animal is frequently accufed falfely of being reflive and vicious; is ufed ili without reafon; and, being furced into defpair, is in a manncr obliged to aet accordingly, be his temper and inclination ever fo well difpofed. It is sery feldom the cafe, that a horfe is really and by nature vicious; but if fuch be found, he will defpife all careffes, and then chaftifuments become neceflary.

Correction, according as you ufe it, throws a horfe into more or lefo violent action, which, if he be weak, be cannot fupport: but a vicious Arong horfe is to be confidered in a very difierent light, being able both
to undergo and confequently to profit by all leffons; of curing and is far preferable to the bett-natured weak one Renivenefe, upon carth. Patience and attemtion are never failing means to rcclain fuch a lorfe: in whatfoever manorer lie defends limfelf, being him back frequently with gerallenefs (not however without hasing given him proper chatlifement if neceffary) to the lefton which he fecms molt averfe to. Hories are by degrees made obedient, through the hope of recompenfe and the fear of pusifinment: how to mix thefe two motives judicioufly together, is a very difincult ratter; it reyuires much thought and practice: and not ouly a good head, but a good licart likewife. The cuoled and bef-natured nider will always fuccecd beft. By a dexterous ufe of the inciternents abow-mentioned, you will gradually bring the horfe to tenper and obedience; mere force, and want of Rkill and conlnefs, would only tend to confirm him in bad cicks. If he be impatient or choleric, never ftrike lim, unlefs he abfotentely refufe to go forwards; which you muft refolutely oblige him to do, and which wil! be of itfelf a correction, by preventing his liaving time to meditate and put in execution any defence by retaiaing himfalf. Refillance in horfes, you mull confider, is fonetimes a mak of Atrength and vigour, and proceeds from fyirit, as well as Cometimes from vice and weakncfs. Weaknefs frequently dives horfes into vicioufnefs, when any thing whercin itrength is neceffary is demanded from them; nay, it inevitably muft : great care hiercfore mould always be taken to dititinguin from which of thefe two caufes any remedy or punifhnent is thought of. It majy fometimes be a bad lign whon horfes do not at ail defend themfetves, and procced from a fluggith difpofition, a want of fpirit, and of a proper fentbility. Whenever one is fo fortunate as to mieet with a horfe of juft the right fivit, activity, delicacy of feeling, with Arength and good rature, he cannot be cherithed too mach : for fuch a one is a rare and ineilimable jewel, and, if properly treated, will in a manner do every thing of himfilf. Horfes are oftener fpuilt by havirg :co mach done to them, and by attempts to drefs them in ton great an hurry, than by any other treatment.

If after a borfe has been well iuppled, and there are no irapedimeats, either natural or accidental, if he fitll perfits to defond himfelf, chaflifements thicu become neceffary: but whenever this is the cafe, they mull not be frequent, but always firm, though always as little violent as polfibe; for they ate both dangerous and very prejulacial when frequently or fighthy phayed with, and alll mere fo when ufed too violently.

It is impofithe, in general, to he too eircumepect in leffons of all hinds, in aids, chatifements, or careffes. Some have quicker parts and more cunning, than others. Many will imperceptibly gain a little cvery day on the ider. Various, in fhort, are hacir difpofitions and capacities. It is the rider's bufinefs to find out their different qualities, and to make them fonfible how much he loves them, and defires to be loved by them ; but at the fame time that he does not fear them, and will be maller.

Plunging is a very common defence among reflive and vicious horfes: if they do it in the fame place, or backing, they mult, by the rider's $\operatorname{leg}$ g and fputs

Yhin Rule firmly applied, be obliged to go forwards, and their
$\begin{array}{ll}\text { H } & O \\ \text { olliged to } \\ \text { Bot forwards, end their } \\ \text { go they do it flying for- }\end{array}$ heads kept up high. But if they do it flying for"ards, kep them back and rider. Of all bad tem- pers and qualities in horfes, thofe which are occafioned by harfh treatment and iguorant riders are the wort.

Kearing is a bad vice, and, in weak horfes efpecially, a very dangerous one. Whillt the horfe is up. the vider mufl yield his hand: and when the horfe is defending, he mult vigorouly determine him forwards: if this be done at any other time but whilf the horfe is coming down, it may add a fpring to his rearing, and make him fall backwards. With a good - hand on them, horfes feldom perfitt in chis vice; for they are themfetves naturally much afraid of falling -backwards. If this method fails, you mutt make the horte kick up behind, by getting fomebody on foot to llike him bthind with a whip; or, if that will not effect it, by pricking him with a goad.

Searting often procieds from a defeet in the fight; which thencore mall be carefully looked into. What. ever the horfe is afiaid of, brme him uo to it gently ; if you carst thin every flep he adrances, he will $\pm 0$ quite up th it be dagrees, and fron grow familiar with all fores of bjects. Nothing but creat gentenefs can correct this fault; for if you infict punimment, the apprehention of diallifement becomes prevalent, and canfen mere flarting than the fear of the ohject. If you let him go by the object, without bringing him up to it, you increafe the fant, and contirm him in his fear: the confequence of which is, he takes his rider perhaps a quite contrary $w^{\prime}$ fy from what he was gring, becomes his matier, and purs timfelf and the perfon upon him cvery moment in greaí danzer

Witn fuch hurles as are to a very great degree fearful of any objects, make a quiet horfe, by going before them, gradually entice them to approach nearer and nearer to the thing they are afraid of. If the horfe, thus alarmed, be undifciplined and headitrong, be will probatily run away with his rider: and if fo, his head mut be kept up high, and the finafle fawed backwards and forwards from ight to left, taking up and yielding the reins of it, as alfo the reirs of the bit: but this later muft not be fawed backwards and forwards like the fnafle, but only taken up and yielded properly. No man ever yet did. or ever will, fup a horfe, or gain any one point uver him, by main force, or by pulling a dead weight againgt him.

## $S_{\text {ect }}$. Vhil. Rules for bud Horfimen.

Robrifin': zuls:.

A N S H I P.
tering, has at the fame time both bridle and llirrup to Piain $\mathrm{h}_{1}$ give. This confufion would be prevented, if every for ba lare was taught to fland till when he is mounted. Forbid your groom, therefere, when he rides your horle to water, to throw himfelf over him from a horfe-block, and kick him with his leg, even before he is fairly upon him. This wrong manner of mounting is what chiefly teaches four horfe the vicious la bit againf which we are here warning. On the other hand, a conflant practice of mounting in the proper manner, is all that is neceflary to prevent a horfe's going on till the rider is quite adjulted in the faddle

The next thing neceffary therefore is, that the rider foould nombt properly. The common method is to thard near the croup or hin 'er part of the horfe, with the bide held very loar in the risht hand. By this manner of hulding the bridle before you mount, you are hable to be kicked: and when you are monned, your horfe may go on fome time, or play what eambols he pteafes, before the rein is mort enough in your bant to prevem him. It is common likewife for an aukward rider, as foon as his foot is in the Hirrup, to throw himfelf with all his force to gan his feat: which he cannot do. till he hath firlt overhalanced himfelf on one fide or the other: he will then wriggle into it by degrees. The way to mount with eafe and fafty is, to tland rather befme than behind the fitrup. In this polture take the bridle fort, and the mane together in your left hand, helping gounfelf to the Atirsup with your right. fo that your toe may not touch the horfe in mounting. When your left foot is in the limrup, move on your right, till your face the fide of the horfe, looking acrofs over the faddle. Then with your right hand grafp the hinder part of the faddle; and with that and pour left, which holds the mane and bridle, lift yourfelf upright on your left foot Remain thus a mere inftant oa your flirrup, only fo as to divise the acten into two motions. While you are in this pollure, you lave a fure hold with buth hands and are at liberty, either to get fafely down, ir to throw your leg over and gain your feat. By this deliberate motion, likewife, you awoid, what evely good horfeman would endeavour to avoid, putting your horfe into a fuster.

When you difmunt, hold the bridle and mane to. gether in jour left hand, as when you mounted; put your rigit hand on the pemmel of the faddle, to raife yourfelf; throw wour leg back over the horfe, grafp the hinder part of the faddle with your right hand, remain a monent on your tirrup, and in every refpect difmount as $y^{\prime o n}$ mounted; only what was your tirit motion when you maunted, beonnes the laft in difmounting. Remember not to hend your right knee in difmounting, lef your fpur flould rub againit the horfe.

It may be next recommended to hold your bridle at a convenient length. Sit fquare, and let not the purchafe of the bridle puil forward your fhoulder ; but keep your body ecen, as it would be if each hand held a rein. Hold your reins with the whole grafp of your hand, dividing them with your little linger. Let your hand be perpendicular ; your thumb will then be uppermoft, and placed on the bride. Bend your wri\&

Ru'es wrif a little outward; and when you pull the bridle, raife your hand toward your breaft, and the lower part of the palm rather more than the upper. Let the bridle be at fuch a length in your hand, as, if the horfe Mould fumble, you may be able to mife his head, and fupport it by the ftrength of your arms, and the weight of your body thrown backward. If you hold the rein too long, you arc fubject to fall backward as your horfe rifes.

If, knowing your horfe perfectly well, you think a tight rein unneceffary, advance your arm a little (but not your (houlder) towards the horle's head, and keep your ufual length of rein. By this means, you have a check upon your horfe, while you indulge him.

If you ride with a curb, make it a rule to hook on the chain yourfelf; the moll quiet horfe may bring his rider into danger, fould the curb hurt him. If, in fixing the curb, you turn the chain to the right, the links will unfold themfelves, and then oppofe a farther turning. Put on the chain loofe enough to hang down on the horfe's under lip, fo that it may not rife and prefs lis jaw, till the reins of the bridle are moderately pulled.

If your horie has been ufed to fand till when he is mounted, there will be no oceation for a groom to hold him : but if he does, fuiffer him not to touch the reins, but that part of the bridle which comes down the check of the horfe. He cannot then interfere with the management of the reins, which belongs to the rider only; and holding a horfe by the curb (which is ever painful to him) is evidently improper when he is to fiand fill.

Another thing to be semembered is, not to ride with your arms and elbows as high as your thoulders; nor let them fhake up and down with the motion of the horfe. The pofture is unbecoming, and the weight of the arms (and of the body too if the rider does not fit fill) acts in continual jerks on the jaw of the horfe, which muf give him pain, and make him unquiet, if he has a tender mouth or any fpirit.

Bad riders wonder why horfes are gentle as foon as they are mounted by Rilful ones, the' their Nill feems snemployed: the reafon is, the horfe goes at his eafe, Iet finds all his motions watched; which he has fagacity enough to difcover. Such a rider hides his whip, if he finds his horfe is afraid of it ; and keeps his le§s from his ficics, if he finds he dreads the fpur.

Avoid the ungraceful cuftom of letting your legs make againtt the fides of the horfe: and as you are not to keep your arms and elbows high, and in metion; fo you are not to rivet them to your fides, but let them fall eafy. One may, at a diltanee, diflinguifh a genteel horfeman from an aukward one: the firit fite fill, and appears of a piece with his horfe; the latter feems flying off at all points.

It is often faid with emphafis, that fuch a one has ro feat on horfeback; and it means, not only that he coes not ride well, but that he does not fit on the right part of the horfe. To have a cood feat, is to fit on that part of the horfe, which, as he fprinss, is the centre of motion ; and from which, of courfe, any weight would be with mof difieulty thaken. As in the rifing and falling of a board placed in aguilibrio, the centre will be always mofl at rell; the true feat

Vol. VIII. Part II.
will be found in that part of your faddle, into which Pain Rules your body would naturalls hide, if you rode without fir bad Itirrups; and is only to be preferved by a proper poife Horiemen. of the body, though the generality of riders imagine it is to be done by the grafp of the thighs and knees. The rider thould confider himfelf as united to lis horfe in this point ; and when fhaken from it, endeavour to reftore the balance.

Perhaps the mention of the two extremes of a bad feat may help to defcribe the true one. The one is, when the rider fits very far baek on the faddle, fo that his weight proffes the loins of the horfe; the other, when his body hangs forward over the pommel of the faddle. The firt may be feen practifed by grooms, when they ride with their flirrups affectedly fhort ; the latter, by fearful horfemen on the leafl flutter of the horfe. Every good rider has, even on the hunting faddle, as determined a place for his thighs, as can be determined for him by the bars of a demi-peak. In. dced there is no difference between the feat of either: only, as in the firlt you ride with fhorter flirsups, your hody will be confequently more behind your knees.

To have a good feat yourfelf, your faddle muf fit well. 'To fix a precife rule might be difficult: it may be a diration, to have your faddle prefs as nearly as poffible on that part which we have defcribed as the point of union between the man and horfe; however, fo as not to obflruct the motion of the horfe's houlders. Place yourfelf in the middle or lowed part of it: fit erect; but with as little conftraint as in your ordinary fitting. The eafe of action marks the gentleman: you may repofe yourfelf, but not lounge. The fet and ftudied erectnefs acquired in the riding-houfe, by thofe whofe deportment is not eafy, appears ungenteel and unnatural.

If your horfe lops mort, or endeavours by rifing and kicking to unfeat you, bend not your body forward, as many do in thofe circumfances: that motion throws the breech backward, and you off your fork or twif, and out of your feat; whercas, the advancing the lower part of your body, and bending back the upper part and thoulders, is the method both to keep your feat, and to recover it when loft. The bending your body back, and that in a great degree, is the greatelt fecurity in Jy:ing leaps; it is a fecurity ton, when your horfe leaps A.unding. The horfe's riling does not try the rider's feat ; the lafh of his hind legs is what ought chiefly to be guarded againf, and is beit done by the body's being greatly inclined back. Stiffen not your legs or thighs; and let your body be pliable in the loins, like the coachman's on his box. This loofe manner of fitting will elude every rough motion of the horfe; whereas the fixture of the knces, fo commonly laid a frefs on, will in great 月nocks conduce to the violence of the fall.

Was the crieket-player, when the ball is fruck with the greatelt velacity, to hold his hand firm and fixed when he receives it, the hand would be bruifed, or perhaps the bones fractured by the reliffance. To obviate this accident, he therefore gradually yields his hand to the motion of the ball for a certain difance ; and thus by a due mixture of oppofition and obedience, catches it without furtaining the leaf injury. The cafe is exactly the fame in riding: the filiful horfeman

Fian Ruke will recover his poife by giving fome way to the mofrithat Hurf men ti)n : and the ignorant horfonan will be flung out of his feat by enlleavonting to be fixad.

Stretch not out your has before you; this will puth you againt the tack of the fadulte: nether gather up your knecs, like a man tiding on a pack; this throws iont thighs unwards: cach pratice unfeats yous. Keep your legs flradetit down; and fit nut on the moft flethy part of the thighs, but turn them inwards, fo as to Fring in your kness and toes: and it is more fafe to ride with the ball of the foot profing on the firmp, than wigh the tirrup as far back as the hetel for the Ireflure of the hecl being in that cafe behind the fire rup, keys the highs down.

When you find your thigls thrown upwards, widen your knecs to get them and the upper part of your fork lower down on the horfe. Grafp the fadde with the holles or inoce part of your thighs, but not $\mathrm{m}: ~ \mathrm{~B}$ than juft to athifl the hatance of your body: this whil alfo enable you to kecp your fpurs from the horfe's filce, and to bring yous tues in, without that affected and adelefs mamer if boingian them in practifed by many. Sink your leels thraigh down ; for while your hedoant thigh keep domn, yum cannot fall: this (aided with the bend of the back) gives the fecurity of a feat, so thofe who lear themfelas up in their therraps in a fwift sollop, or in ile alternate rifing and falling in a full :rot.

Let your feas ditermine the length of your Rirrups, rather ihan the fitmrens your feat. If more precilion is requifite, let your tirrups (in the hanting faddle) be of fuch a bensth, as that, wene you tand in them, there may be tha breadth of four fingera between yout feat and the faddle.

It would arealy affit a learner, if he would practife riding in a lurese circle, as directed fret. ii. without themps: kecpen his face looking on its outward part of the circle for as not to have a full view of the purfe's laces, bat $j$ fi of $t$ ! at ear which is on the nut. ward part o: the ciscle: and his; houlder, which is towards the contre f the corcle, wery forwatd. By this I'cans vou learn tu badnce yourbody, and keep a true fear, indopostont of you dirups : you may probably ikcwite ofeafe a fall, thould you at any time lofe them ly beine actichtally haken from your fat.

As the $f$ at in me meatate depends on the faddle, it niay tot be anifs to undore, that becaule a faddle with a high pormmel is thought congeruls, the other extreme prevails, and the pmonal is fearce allowed to he higher than the midule of the faddle. The taddle thould lie as near the bat-bone as can be, without hating the horfe; fot the nearer you fit ou his back, the better feat ou have. If it does fo, it is plaia the pomms mutt ife enough to fecure the withers from preffure: therefore, a horife whofe withers are higher than common, ry fuires a hirher pormmel. If, to avoid this, you make the fadd'e of a ruope traight line, the inconventers. fern of fullows; you fit too much above the horre's back, nor can the faddle form a pro. ver feat. There thould be no ridge from the Lut. ion at the fide of the pommel, to the back part of the fadde. Thar line :llo fould be a little concare, for your thighs in lie ut eafe. In mort, a faldle suntit to be, at natay as gusuble, as if cut out of the sorie.

When you want your horfe to move forward, raife his head a little, and touch hin gently with your whip; or ehe, prefs the calves of your legs againit his Gides. If he does not move falt enough, prefs them with more force, and fo till the fpur jult touches him. By this practice he will (if he has any firit) move upen the lear prefiure of the leg. Never fpur him by a kiek; but if it be neceffary to fpur him brikly, kecp your heels clofe to his fides, and flacken their force as he becomes obedient.
When your horfe attempts to be vicions, take each icin feparate, one in each hand, and advancing your arms forward, huld him very thon. In this cafe, it is common for the rider to pull him hard, with has arens low. But the horfe by this means having his head low too, has it more in his powet to throw our his heels: whereas, if his head be raifed very high, and his nofe thrown out a little, which is contquent, he can neither rife before nor behind; becaufe he can give himfolf netither of thofe motions, withont having his head at liberty. A plank placed in aquilibrio, cannot rife at one end unlefs it finks at the other.

If your horfe is headitrong, pull not with one continued pull, but flop, and back him often, jult fhaking the reins, and making little repeated pulls till he obeys. Horfus are fo accultomed to bear on the bit when they go forward, that they are difouraged if the rider will not let them do fo.

If a horfe is loofe-necked, he will throw up his head at a continued pult; in which fituation, the nider, feeing the fromt of his face, can have no power. wer him. When your horle does thus, drop your hand and give the bridle play. and he will of courle drop his head arain into its proper place: while it iz coming down, make a fecond gente pul!, and you will find his mouth. With a little practice, thic is done almult intantanenully; and this method will thop, in the difance of a few yar's, a hore, which will ma away with thofe who pull at him with all their might. Amolt every one mait have obferved that when a horfe feels hinfelf pullid with the bridle, even when he is guing gentiy, he often miftakes what was defiguedto flop him, as a ditcection to bear on the bit and to. go fater.
Keep your hofe's head high, that he may raife lise. neck and crelt ; play a little with the rein, and nove the bit in hes mouth, that he may no: prefo on it in. one contant and eontinued manuer: :otat afraid of taifug his head too high: he will naturally be too rearly to bing it dow, and tire your arms with its weight, on the leall abatement of his mettle. When you feel him heavy, flop him, and make him go back. a few paces: thus you break by degrees his propenfity: to prets on his bride.

You cught not to be pleafed (though many are) whih a reund neck, and a head drawn in towards his beaff: let your horfe carry his head bridling in, pro-. sided he carries it high, and his neck arching upwards: hut if his neck bends downwards, his figure is bad, his fight is ton near his toes, he leans on the bridke, and you have no command over him. If he goes preffing, but lightly on the bridle, he is the more fure-footed, and goes pleafanter ; as your wrift only may guide hum. If lie hangs down his head, and makes you fupport. the weight of that and his neck with your arms bear-
ing on his fore legs, (which is called being on his gooulders), he will Arike his tocs againft the ground, and fumble.

If your horfe is heavy upon the bit, tie him every day, for an hour or two, with his tail to the manger, and his head as high as you can make him lift it, by a rein on eacb polt of the flall, tied to each ring of the fraffle bit.

Horfe-breakers and grooms have a great propenfity to bring a horfe's head duzu, and feem to have no feat without a ftreng hold by the bridle. They know indeed, that the head fhould yicld to the reins, and the neck form an arch; but do not take the proper pains to make it an arch upzeard. A temporary effect of attempting to raife a horfe's head, may perhaps be making him pufh out his nofe. They will here tell you, that his head is too high already; whereas it is not the diftance from his nofe, but from the top of his head to the ground. which determines the head to be high or low. Befides, although the faule is faid to be in the manner of carrying the head, it fhould rather be faid to be in that of the neek; for if the neck was raifed, the head would be more in the pofition of one fet on a well formed neck.
The defign therefore of lifting up the head, is to raife the neck, and therely bring in the head; for even while the bride makes the fame line from the rider's hand to the bit, the horfe's noie may be either drawn in, or thrult out, according as his neck is raifed or depreffed. Inftead of what has been here recommended, we ufually fee colts bruke with their heads caveffoned very low, their necks fiff, and not in the leaft fuppled. When the breaking-tackle is left off, and they are mounted for the road, having more food and ref, they frequently plunge, and a fecond breaking becomes necelfary. Then, as few gentlemen can manage their own horfes, they are put into the hands of grooms, from whom they learn a vatiety of bad habits.

If, on the other hand, your horfe carrits his head (or rather his nofe) too high, he generally makes tome amends by moving his fhoulders lightly, and roing fafely. Attend to the caufe of this fault. Some horfes have their necks fet folow on their houlders, that they bend firt down, then upwards, like a llag's. Some have the upper line of their necke, from their ears to their withers, too flort. A head of this fort cannot poflibly bend inwards and form an arch, becaufe the vertebia (or neck boncs) are too thort to admit of fexure ; for in long and hort necked horfes the number of the vertebre is the fame. In fome, the jaw is fo thick, that it meets the neek, and the head by this means has not room to bend. On the other hand, fome bave the under line from the jaw to the breath fo thort, that the neck cannot rife.

In all thele cafes you may gain a little by a nice hand with an eafy bit ; but no curb, martingale, or other forcible method, will teach a horfe to carry his head or neck in a poiture which nature lias made uncafy to him. By trying to pull in his nofe farther than he can bear, you will add a bad habit to nature. You could not indeed contrive a more effectual method to make him continually tots his nofe up, and throw his foam over you.
The rule already given to ride a loole-necked harfe,
will be a proper one for all light-mouthed horles: one Plain Rules caution being added, which is, always to fearch whe for bad ther his faddle or girths may not in fome way pinch him; and whether the bit may not hurt his lip by being too high in his mouth : becaufe, whenever he frets from either of thefe caufes, his head will not be fleady.

It is a common cuftom to be always pulling at the bridle, as if to fet off to advantage either the fpirit of the horfe, or the diill of the rider. Our horfes therefore are taught to hold their heads low, and pull fo, as to bear up the rider from the faddle, fanding in his flirrups, even in the gentef gallop: how very improper is this, we are experimentally convinced, when we happen to meet with a horfe which gallops otherwife. We immediately fay, be canters excellently. and tind the eafe and pleafure of his motion. When horfes are defigned for the race, and fwiftnefs is the only thing confidered, the method may be a good one.

It is not to be wondered that dealers are always pulling at their horfes; that they have the fpur conflantly in their fides, and are at the fame time continually checking the rein: by this means they make them bound, and champ the bit, while their rage has the appearance of fpirit. Thefe people ride with their arms fpread, and very lowv on the houlders of their horles: this method makes them flretch their neeks, and gives a better appearance to their fore-hands; it conceals alfo a thick jaw, which, if the head was up, would prevent its yieldny to the bit; it hides likewife the ewe-neck, which would otherwife thow itfelf. Indeed, if you lave a horfe unllady to the bit, furmed with a natural heavy head, or one which carries his nofe obllinately in the air, you mult find his mouth where you can, and make the beft of him.

Many horfes are tanght to fart by whipping them for farting. How is it poffible they can know it is defigned as a punifment? In the riding-houle, you teach your horfe to rife up before, and to fpring and lath out his hinder legs, by whipping him when tied between two pillars, with his hesd a little at liberty. If he underllood this to be a punifment for doing fo, he would not by that method learn to do it. He feems to be in the fane manner taught to fpring and fly when he is frightened. Moft horfes would go quietly patt an objeet they were beginning to fly from, is their riders, inttead of gathering up their bridles, and howing themfelves fo ready, hould shrow the reins loofe upon their neeks.

When a horfe flarts at any thing on one fide, molt riders turn him out of the road, to make him go up to what he tlarts at: if he does not get the better of his fear, or radily comply, he generally goes pall the object, making with his linder parte, or croup, a great circle out of the roal; whereas, he fhould learn to keep Itraight on, without minding objects on cither fide.

If he ftarts at any thing on the left, hold his lead high, and keep it traight in the road, pulling it from looking at the thing le flarts at, and keeping your right leg hard prefled againft his fide, towards his flank: he will then go Jtraight along the road. By this method, and by turning his liead a little more. he may be furced with his croup clofe up to what frightened him; for as his head is pulled one way, his croup neceflarily turns the other. Always arvid a

Plain Rule quarrel with your horfe, if you can: if he is apt to for bad tlart, you will find occafions enough to exercife his Horemen. obedience, when what he tharts at lies direetly in his way, and you mu/l make hin pals; if he is not fubjeet to itart, you thould not quarrel with him about a trifle.

It nunt be obferved, however, that this rule in going paft an object may perhaps be a little irregular in a managed horfe, which will always obcy the leg: but even fuch a horfe, if he is really afraid, and not Jettive, it may not be amifs to make look another way; unlefs the object be formething you would particularly accuthom him to the fight of.

The cafe will alfo be different with a horfe whofe far is owing to his being not ufed to objects; but fuch a one is not to be rode by any horfeman to whom thefe rules are directed: the ilarting here meant arifes merely from the horfe's being pamper'd, and fpringing through livelinefs.

The notion of the neceffity of making a hurfe go immediately up to every thing he is afraid of, and not fuffering him to become matter of his rider, feems to be in general carricd too far. It is an approved and good method to conquer a horfe's fear of the found of a drum, by beating one near to him at the time of feeding lim: this not only familiarizes the noife to him, but makes it pleafant, as a fore-runner of his meat *; whereas, if he was whipped up to it, he might perlaps flart at it as long as he lived. Might not this be applied to his ftarting at other things, and fhow that it would be better to fuffer him (provided he does not turn back) to go a little from and avoid an object he has a diflike to, and to accultom him to it by degrees, convincing him, as it were, that it will not hurt him ; than to punifh him, quarrel with him, and perhaps fubmit to his will at latt, while you infita on his overcoming his fear in an inttant? If he fees a like object again, it is probable he will recollect his dread, and arm limfelf to be difobedient.

We are apt to fuppofe that a horfe fears nothing fo much as his rider: but may he not, in many circumiltances, be afraid of inftant deftruction? of being cruthed? of being drowned? of falling down a precipice? Is it a wonder that a horfe fhould be afraid of a loader, wargon? may not the hanging load feem to threaten the falling on him? There cannot be a rule more general, than, in fuch a cafe, to thow him there is room for him to pals. This is done by turning his head a very little from the carriage, and preffing your leg, which is fartseft from it, againg his fide.

A horfe is not to flop without a fign from his rider. -Is it not then probable, that when driven up to a carriage he flarts at it, he conceives himfelf obliged cither to attack or run againft it? Can he underfand the rider's fpurring him with his face direfted to it, as a fign for him to pafs it?' That a horfe is eaflly alarmed for his face and eyes (he will even catch back his head from a hand going to earefs him) ; that he will not go with any force, face to face, even to another borfe (if in his power to top); and that he fees persectly fideways, - may be ufful hints for the treatment of horfes with regard to flarting.

Though you ought not to whip a horfe for ftarting, there can be no good effect from clapping his neek wigh your hand to encourage him. If one took any
notice of his ftarting, it Mould be rather with \{ome Phan Ruh tone of woice which he ufually underfood as an ex. preffon of ditike to what he is doing; for there is oppyfition mixed with his flarting, and a horfe will ever repeat what he finds has foiled his rider.

Notwithftanding the directions above given, of not prefling a horfe up to a carriage he darts at ; yet if one which you apprehend will frighten him meets. you at a narrow part of the road, when you lave once let him know he is to pafs it, be fure you remain determined, and prefs him on. Do this more efpecially when part of the carriage has already paffed you: for if, when he is frightened, he is acculoned to go back, and turn round, be will certainly do it if he finds, by your hand flackening, and legs not preffing. that you are irrefolute; and this at the mofl dangerous point of time, when the wheels of the carriage take him as he turns. Remember not to touch the curb rein at this time; it will certainly cheek him. It is not known to every one, that the perfion who would lead a horfe by the bridle, fhould not turn his face to him when he refufes to follow him: if, befides this, he raifes his arms, hows his whip, or pulls the bridie with jerks, he frightens the horfe, inltead of perfuading him to follow; which a little patience may bring about.

Ride with a fnaffle: and ufe your curb, if you have one, only occationally. Choofe your fattle futl and thick in the mouth, efpecially at the ends to which the reins are faftened. Mott of them are made too fmall and long; they cut the horfe's mouth, and bend back over the bars of his jaw, working like pincers.

The management of the curb is too nice a matter to enter on here, farther than to prefcribe great caution in the ufe of it : a turn of the wrill, rather than the weight of your arm, fhould be applied to it. The elalticity of a rod, when it hath hooked a fill, may give you fome idea of the proper play of a horfe's, head on his bridle; his fpirit and his pliablenefs are both marked by it.

A horfe fhould never be put to do any thing in a curb which be is not ready at: you may furce hin, or pull his head any way with a fnaffle; but a curb atts only in a ftraight line. It is true, that a horfe will be turned out of one track into another by a curb, but it is becaufe he knows it as a fignal. When he is put to draw a chair, and does not underftand the neceffity he is then under of taking a larger fweep when he turns, you frequently fee him refive, as it is then called: but put lim on a fraffle, or buckle the rein to that part of the bit which does not curb him; and the horfe fubmits to be pulled about, till he underftands what is defired of him. Thefe directions fuppofe your horfe to have fpirit, and a good mouth : if he has not, you muft take him as he is, and ride him with fuch a bit as you find moft eafy to yourfelf.

When you' ride a journey, be not fo attentive to your horfe's nice carriage of himfelf, as to your encouragement of him, and keeping him in good humour. Raife his liead; but if he flags, you may indulge him with bearing a little more upon the bit than you would fuffer in an aising. If a horfe is lame, tenderfooted, or tired, he naturally hangs upon his bridle.

Rule, On a journey, therefore, his mouth will depend greatly on his Atrength and the goodnefs of his feet. Be then very careful about his feet, and let not a farrier fpoil them. You will be enabled to keep them from danger, by the directions given under the article Farriery, p. 167.

Very few, although pratifed in riding, know they have any power over a horfe but by the bridle; or any ufe for the fpur, except to make him go forward. A little experience will teach them a farther ufe. If the left fpur touches him (and he is at the fame time prevented from going forward), he has a fign, which be will foon underftand, to move fideways to the right. In the fame manner to the left, if the right \{pur is elofed to him: he afterwards, through fear of the fpur, obeys a touch of the leg; in the fame manner as a horfe moves his croup from one fide of the ftall to the other, when any one Atrikes him with his hand. In thort, his croup is guided by the leg, as his head is by the bridle. He will never difobey the leg, unlers he becomes refise. By this means you will have a far greater power over him : he will move fideways, if you clofe one leg to him; and Araight forward, if both : even when he flands Aill, your legs held near him will keep him on the watch; and with the flightef, unfeen motion of the bridle upwards, be will raife his head, and how his forehand to advantage.

On this ufe of the legs of the rider, and guidance of the croup of the horfe, are founded all the airs (as the riding. nafters exprefs themfelves) which are taught in the manege; the palfage, or fide-motion of troopers to elofe er open their files, and indeed all their evolutions. But the convenience of fome degree of this difcipline for common ufe is the reafon of neentioning it here. It is ufeful if a horfe is apt to flumble or thart. If to the firt, by prefling your legs to his flank, and keeping up this head, he is made to go light on his fore-legs, which is aiding and fupporting him; and the fame if he does actually flumble, by helping him at the very inflant to exert himfelf, while as yet any part of him remains not irrecoverably impreffed with the precipitate motion. Hence this ufe of the hand and legs of the rider is called giving aids to a horfe; for, as to holding up the weight of a heavy unadive horfe, by mere pulling, it is as impoffible as to recover him when falling down a precipice.

A horfe is fupported and helped by the hands and legs of his rider in every action they require of him; hence he is faid to perform his airs by the aids from his rider.

The fame manner is ufeful if a horfe farts. For if Plain Rules when he is beginning to fly to one fide, you leg on for bad the fide he is fying to, he flops his fpring immedi- $\underbrace{\text { Horfemen. }}$ ately. He goes paft what he tarted at, keeping Araight on, or as you cloofe to direct him; and he will not By back from any thing if you prefs him with both legs. Yon keep his hanncles under him, going down a hill; help him on the fide of a bank ; more eafily avoid the wheel of a carriage; and approach more gracefully and nearer to the fide of a coach or horfeman. When a pampered horfe curvets irregularly, and twitts his body to and fro, turn his head either to the right or left, or both alternately (but without letting him move out of the track), and prefs your leg to the oppofite fide: your horfe cannot then fpring on his bind-legs to one fide, becaufe your leg prevents him; nor to the other, becaufe his head looks that way, and a horfe does not Aart and fpring to the fide on which he looks. Here it may not be amifs to obferve the inpropriety of the babit which many riders have, of letting their legs make againt the fides of the horfe: if a horfe is taught, they are then continually preling him to volent action; and if he is not, thes render him infenfible and incapable of being taught. The fretting of a hot horfe will hence be exceffive, as it can no otherwife be moderated than by the utmoft fillnefs of the feat, hands, and legs of the rider.
Colts at firt are taught to lear a bit, and by degrees to pull at it. If they did not prefs it, they could not be guided by it. By degrees they find their necks ftronger than the arms of a man; and that they are capable of making great oppotition, and often of foiling their riders. Then is the time to make them fupple and pliant in every part. The part which of all others requires mot this pliancy is the neck. Hence the metaphor of filf-necked for dijoledient. A horfe cannot move his head but with the mufcles of his neek: this may be called his hith; it guides his courfe, changes and directs his motion.

The ufe of this pliancy in the different parts and limbs of a horfe has been already hown in a formerfection. The prefent fection being directed to the unexperienced horfeman, it may fuffice to add, that bis idea of fupplenefs need only be, that of an ability and readinefs in a horfe to move every limb, on a fign given lim by the lands or legs of his rider; as alfo, to bend liis bndy, and move in a flort compafs, quick and collected within himfelf, fo as inflantly, to be able to perforin any other motion.

## $\mathrm{H} \mathrm{O} \quad \mathrm{R}$

HORSHAM, a town of Suffex, feated near St Leonard's foreft, 38 miles from London.' It has its name from Horra, brocher to Hengitt the Saxon; and is one of the largeft towns in the county. It has fent members to parliament ever fince the 3 cth of Edward I. and is the place where the county gaol is held, and often the affizes. It is a borough by prefcription, with the title of two bailiffs and burgage-holders within and without the borough, \&c. who elect the members of

## $\mathrm{H} O \mathrm{R}$

parliament, and they are returned by the bailifs chofe Horfias: jearly by a court leet of the lord of the manor, who return four candidates to the fleward, and he nominates two of them for the office. Here is a very fine church, and a well $\in$ ndowed free- Cchool. Great flore of poultry is bought up for London at its market on Saturday, and it has a patent alfo for a monthly raarket.

HORSTIUS (James), profefor of medicine in the
paiverity

Hotius univerfity of Helmfadt, in the thin century. He phytic. He carefully prayed to God to blefs his p:efriptions, and publimed a form of prayer upon this fubject. He alio wrote, 1. A ticatife on the qualities of a good plyyician. 2. Another on the qualitics of a good apothecary. 3. A treatife of the plague, in German. 4. A commentary in lilros Hippuirutis de corte, and other works.

Horstius (Gregory), nephew of the former, called the AFicuhtaius of Gormany, publifhed feveral books, which are ctteemed.

HOR'TAGlleRS, in the grand fgaior's court, upholferers, on tapettry-langers. The grand lignior has condantly 400 in his retimue wher he is in the camp: thefe go always day's journey before him, to fix upon a proper place for lis tent, which they preFare fall ; and afterwats thofe of the officers, according to their rank.

HOR'IENSIUS (Quintus), a celebrated Roman orator, the cotemporary of Cicero, pleaded with univerfal applaufe at 19 years of age, and contimed the fanse profeffion during 49 years. But being at lat eclipfed by Cicero, he quited the bar, and embraced a military life; became a military tribune, prator, and afterwards conful, about $70 \mathrm{~B} . \mathrm{C}$. Cicero fpeaks of him in fuch a manner as makes us regret the lofo of his orations Hortenfius had a wonderiul memory, and delivered his orations without writing down a ffugle word, or forgettiag one particular that had been adranced by his adverfaries. He died very rich, a little before the civil war, which he had endeavoured by all puffible means to prevent.

Hor'tus siccus, ama garden ; an appellation given to a collection of fecintens of plants, carefully dried and picierved.

The value of fuch a collection is very evident, fince 1000 minutixe may be preferved in the well dried fecinens of plants, which the molt accurate engraver would overlook. We fhall therefore give two methods of drying and preferving a hortus fucus; the fritl by Sir Rubert Southwell in Philolophical Tranfactions, $\mathrm{n}^{\circ} 23-$; and the other by Dr Hill, in his review of the works of the Royal Society, with his objections to Sir Robert's method.

Accoriing to the former geatleman, the plants are to be laid flat between papers, and then put between two fnooth plates of iron, ferewed together at the corners; and is this condition conmitted to a baker's oven for two hours. When taken out, they are to be rubbed over with a mixture of equal parts of aquafor. is and hrandy; and after this to be faltened down on paper with a Colution of the quantity of a walnot of gum tragacanth difolved in a pint of water. Sce Herdar.

Tothis the Doctor objects, that the heat of an oven is much too macertain to be employed in fonice an operation; and that the face of time ordered for continumg the plants in it is of no information, unlefs the degree of heat, and teven the difterent nature of the plant as to its fucculcncy and the firm. nefs or tendernefs of its libres, be attended to; there being fearcely any two plants alike in thefe particulars: confequently the degree and duration of heat futhient for one plant would deltroy another. Befide which,
the acid ufed deftroys the colvur of many plants; and never lecovers that of others lont in the drying; and frequ:ntly after the plant is fixed down, rots both the paper it is hixed to, and that which falls over it. Dr Hill's method is as follows. Take a fpecimen of a plant in Hower, and with it one of its bottom leaves if it have any ; bruife the ftalk if too rigid, or flit it if too thick: fpread out the leaves and flowers on paper, cover it with more paper, and lay a weigbt over all. At the end of 18 hours take out the plants, now perfectly flattened, and lay them on a bed of dry common land; fift more dry fand over them to the depth of two inches, and thus let them lie about three weeks: the lefs fucculent dry much fooner, but they take no harm afterward. If the foor of a garret be covered in fyring with fand two inches deep, leaving face for walking to the feveral parts, it will receive the collection of a whole fummer; the covering of fand being lifted over every parcel as laid in, they need no farther care from the time of laying them till they are taken up to be ftuck on paper. The cement ufed by the Doctor is thus prepared : early in the fpring, put twe onnces of camphor into three quarts of water in a large bottle, thake it from time to time, and when the firth collected plants are ready for the faftening down, put into a pint of the water, poured off into an earthen veffel that will bear the fire, two ounces of common glue, fuch as is ufed by the carpenters, and the Came quantity of ichthyocolla beat to threds; let them ftand 36 houts, then gently boil the whole a few moments, and thrain it off through a coarfe cloth: this is to be warmed over a gentle heat when it is to be ufed, and the back of the plants fincared over with a painter's brufh : after this lay them on paper, and gently prefs then for a few minutes, then expofe them to the air a little; and finally, lay them under a friall waight between quires of papor to be perfectly dried.
It is fearee to be conceived how Itrongly the water becomes impregnated with the camphor by this fimple procefs: a part of it indeed tlies off in the making of the cement and the ufing of it : but enough remains with the plants to prevent the breeding of infects in it. He farther oblerves, that plants may be dried very well without fand, by ouly putting them frequently into freth quires of paper, or a few, by only preffing them between the leaves of a book: but the fand method preferves the colour beft, and is done with leaft trouble.
Another method much better than that of the oven is the flattenning and drying the plant by pafing a common finoothing iron for linen over the papers between which it is lide: but for nive things the molt perfect of all methods is that by a common fand heat, fuch as is ufed for chemical purpoles. The cold fand is to be fpread finouch upon this occafion, the plant laid on it carefully flitted, and a thick bed of fand iifted over: the fire is then to be made, and the whole procefs carefuily watched until by a very gentle heat the plant be carcfully dried. The colour of the tenderell herb may by this namer be preferved; and Howers, that can no wady elfe be profersed, may be managed pertictly well this.

LiORUS, a renowned deity of ancient Egypt. He was an emblem of the fun. Plutarch (in hig treatife de Ifide of Ufride) fays, "that virtue which peclides

## H O S

over the fun, whillt he is moving through fpace, the Egyptians called Horus and the Grecks Apollo." Job alfo calls Ur or Orus the fun-" If I gazed upon the furs (L'r, Orus) when he was fining, or on (Yurricha) the moon walk ing in brigh'nefs, arid my heart hath been feverty enticed (i.e. so worhip), or my moush bath kiffed my hand ; this allo were an iniquity to be punifhed by the judge, for I thould have denied the God who is above." Cl ap xxxi. ver. 26, 27, 28.

The interpretation left by Hermapion of the hieraglyplies engraved on the el blik of Heliopolis (aceording to Ammiamis Marcellinus), offers thefe remarkable words: "Horus is the fupreme lond and author of time." Thefe qualitis, it is known, were chictly attributed to Ofiris: that they may apply, therefore, to Horus, he mult neceffiatily denote the flar of the day in certain circuinflances: and this is what is explained to us by the oracle of $A_{i}$ wllo of Clarus:

$$
\begin{aligned}
& \text { 1.rarn that the liff "t the go isio Ja . }
\end{aligned}
$$

$$
\begin{aligned}
& \text { The foe in funm } r \text {, and wwarts the ent ot ausuman the } \\
& \text { tender firo. }
\end{aligned}
$$

The far of the day, on attainine the fummer follice, and called per cacellentiun The fin, is the fame as $\mathrm{H}_{\mathrm{H}}$ rus. In faet, the Easuptians reprefented ham borne on lions, which igniified his entratue ino the fign of the Jion. They whe peffided ove :he divine inditutions, then placed fphynxes at the hide of the canals and facred fontains, to warn the peopl. of the apploach ing inundation. Macrobiust, who informs us why the Greeks gave Horn. the mame of Apollo. confirms this fentiment: "In the mylleries (fays he) they diforer as a feeret, which ought to be inviolable, that the fun arrive: in the upper hemifphere, is called Apollo." Thefe eeftimonies concur in proving, that this emble. matical deity was no other than the flar of day, paffing through the figns of funmer.

Thefe lights may lead us to the explication of the fiered fable, which the prielts pubthed on the fubject of Horus; for they enveloped in mytery every point of their religion. Plutach gives ic at length in his steatife of lis and Oinis: Of the following are the principal traits. They faid that he was the fon of Ofiris and of Ifrs; that I'yphon, after killing his brother Oliris, took porteftion of the kingdom; that Horus, leaguing hintelf with Jfix, avenged the death of his fother, expslted the tyrant from his throne withant depriving him us life, and reigned glorivany in E. gypt. A perfon who has travilied ever fo little in Egypt, eafily difoovers natural phenomena did under the veil of fable. In the Epring, the wind khomina frequently makes great ravages there. It raifes whirlwinds of burning fands, which fuffucate travillers, darken the air, and cover the face of the fun in fach a mauner as to leave the carth in perfect chacurity. Here is the death of Offis and the reign of "Typhon. Thefe hurricanes break lonfe wailly in the wonths of February, March, and April. When the fua approaches the fign of the lion, he changes the bate of the at mofphere, difperfes thefe tempefes, and reftomes the notherly winds, which drive before thetn the ma. lignant vapours, and preferve in Egypt coolnefs and falubrity under a buming fley. This is the tuitmpit of Horus over Typhon and his glorious reign. Ao the
natural philofophers aeknowled ge the influence of the moon over the ilate of the atmofphere, they united her with this god, to drive the ufurper from the throne. The priells contidering Oliris as the father of time, might beftow the name of his fon on Horus, who reigned three months in the year. Thlis, according to Mr Savary $t$, is the natural explication of this alle-
 gory. And all enlightened men, he thinks, mult have $E_{\text {Letters }}$ er underftood this language which was familiar wo have E; pr, 14 . The people only, whofe feeble fight extends no tarther than the exterior, wihout diving into the true meaning of things, might regard thefe allegorical peifonages as real god, and decree prayers and offerings to them.
Jathonfsi, whon has interpreted the epithet of Arueri, whicin the Ergptians gave to Horus, pretends that it lignities cthicacious virulue. Thefe expreftions perfuety chancterife the fhenomena which happened during the regg of this got. It is in fummer, in fact, that the fum manifells all its power in Egype. It is then that he fwells the waters of the river with rains, extaled by him in the air, and driven againtt the fummits of the Absmian mountains; it is then that the hufbudman reckons on the trea ures of agrienlture. It was natural for then to honour him with the mant of $A-$

HOSANNA, in the Hebew ecremonies, a prayer which they rehearfed on the feveral days of the feaft of thematies. It was thus called, becaufe there was frequent repetition therein of the word wisen, forea nami, or ferwa precor; i.c. fave us now; or, fave ut, we pray.
there are divers of thefe hofannahs. The Jews call them bofccaznoth; i. e. the bofisnmaks. Some are rehearid on the firll day, others on the fecond, \&ic. which they call bofianna of the firtt day, bafonna of the fecond day, se.

Hos.avina Rubla, or Grand Hofonna, is a name they give to their featt of tabernackes, which lafte eight days: becaufe, duting the courfe thencof, they are frequently calling for the affilance of God, the forgivends of their funs, and his blifing on the new year; and to that purpofe they makt great ufe of the hofchanurth, or prayers above mentioned. - The Jews alro apply the termi bufina rabla, in a more peculiar manaer, to the feventh day of the feat of tabernacles; becaufe they apply theniflves more immediately on that day to invoke the divine blelag, \&ec.

HIOSCHIUs (Sidromius), a jeluir, who was horn at Mathe, in the diucefe of Ypres, in 1596, and dicd at 'lougres in 1053. He wrote fone elegies and ohher puem. in Lation with great purity and elegance.

HOSE, from the Saxon Hoja, a Rucking. See Stucking.

HOSEA, a canonical book of the Old Teflament, fo calld from the prophet of that name, its auther, whe was the fon of Beri, and the lisit of the leffer prophets. He lived in the kingdum of Samaria, and deliicred his proplefes under the reign of Jeroboam FI. and his fucceflore, kings of lfracl; and under the reigns of Laziah, Jothan, Ahaz, and Hezekiah, kings of Jucah. His primupaldetisn is to publifin the grofs idu. laties of the people of 1 fracl and Judah, $t$, denounce the divinc vergance agame then, and to furetel thes captivity in Alfyria.

## H O S

forpinian, Hoflital.

HOSPINIAN (Rodolphus), one of the greateft writers that Switzerland bas given birth to. He was born in $15+7$, at Altorf near Zurich; obtained the freedorm of Zurich; and was made provifor of the abbey fchool. Notwithtanding this employment, he undertook a noble work of vaft extent, which was a Hifory of the Errors of Pofery. Though he could not complete this work according to kis plan, he publimed fone eonfiderable parts of it: what he publifhed on the Eucharit, and another work called Concor dia Difcors, exceedingly exafperated the Lutherans. He did not reply to them; but turning his arms againt the Jefuits, publithed Hijoria Yefietica, \&c. Thcfe witings gained him preferment; he being appointed archdeacon of Caroline church, and then minitter of the abbey-church. He died in 1626 ; and there was an edition of his works publifhed at Genera 1681, in feren wolumes in folio.
hospll'Al, popularly Spittal, a place or building erected, out of charity, for the reception and fupfort of the poor, aged, infirm, fick, and otherwife helplefs. The word is formed of the Latin bolpes, "hot, Aranger." See Host.

In the ages of the church, the bihop had the immediate charge of all the poor, both found and difeafed, as alfo of widows, orphans, Itrangers, \&c.When the churches came to have fixed revenues allotted them, it was decreed, that at leaf one fourth part thercof fhould go to the relief of the poor; and to provide for them the more commodiouly, divers houfes of charity were built, which are fince denominated hofpitals. They were governed wholly by the pricts and deacons, under the infpection of the bithop. In courfe of time, feparate reverues were afligned for the hofpitals; and paticular perfons, out of mosives of piety and charity, gave lands and money for crecting of hofpitals. When the church difcipline began to ielax, the priens, who till then had been the adminittrators of hofpials, converted them into a fort of benetices, which they held at pleafure, without giving account thercof to any body; referving the greatelt part of the income to their own ufe; fo that the intentions of the founders were fruftrated. To rer.ove this abufe, the council of Vienne exprefsly prohibited the giving any hofpital to fecular priets in the way of a benefice; and directed the adminittration thereof to be given to funficient and refpomible laymen, who hould take an oath, like that of tutors, for the faithful difcharge thereof, and be accountable to the ordinaries.-This decree was executed and confirmed by the council of Trent.

In Britain, hofpitals are huildings propety endowed, or otherwife fupported by charitable contibutions, for the reception and fupport of the poor, aged, intirm, fick, or helplefs.

A charitable foundation laid thus for the fuftenance and relicf of the poor, is to continue for ever. Any perfon feized of an eftate in fee, may, by deed inrolled in chancery, erect and found an hofpital, and ne. minate fuch beads and goveriors thetein as he thall think fir; and this charitable foundation fhall be in. corporated, and fubject to the infpection and guidance of the heads and vifitors nominated by the founder. Iikewife fuch corporations had have, take, and furNo $15 \%$
chafe lands, fo as not to exceed 200 l. a year, provided the $H$.f fame he not held of the king; and to make leafes, refer- Hofpi ving the accuftomed yearly rent. Sce Corporation.

HOSPIT'AL. (Michael de l'), chancellor of France in the 16 th century, was one of the greatelt men of his age, and had raifed himflf by degrees. He agreed to an edict much feverer again!t the Proteftants than he could have wihed, to prevent the introduction of the inquifition. It was that of Romorantin. The fpeeches he made, in order to infpire a fpirit of toleration, made him much fulpected by the Roman Catholics, and extremely odious to the court of Rome. The maxims of flate upon which he regulated himfelf were of great advantage to France, fince he formed fome difciples who oppofed, in proper time, the pernicious attempts of the leaguers, and rendered them abortive.His pacific views being diniked by Catharine de Medicis, who had contributed to his advancement, the excluded him from the council of war, and occafioned his difgrace. He retired, however, of his own accord, in 1568; and fpent the reft of his life at his country-feat at Vignai, where he died in 1573, aged 68. His poems are efteemed. He alfo publifhed fome excellent fpeches and memoirs.

Hospital (William-Francis-Antony, marquis of), a great mathematician of France, was born of an ancient family in 1661. He was a geometrician almont from his infancy; for one day being at the duke of Rohan's, where fome able mathematicians were fpeaking of a problem of Pafchal's which appeared to them extremely difficult, he ventured to fay, that he belicued he could folve it. They were amazed at fuch prefumption in a boy of 15 , for he was then no more; neverthelefs, in a few days he fent them the fobution. He entered early into the army, and was a captain of horfe; but being extremely hurt-ighted, and expofed on that account to perpet ual inconveniences and errors, he at length quitted the army, and applied himfelf entirely to his favourite amufement. He contracted a friendfrip with Malbranche, and took his opinion upon all occafions. In 1693, he was received an honorary member of the academy of friences at Paris; and he publifhed a work upon Sir Ifaac Newton's calculations, intitled, $L$ 'Aralyye des infinimens prtits. He was the firlt in France who wrote upon this fubject ; and on this account was regarded almoft as a prodigy. He engaged afterwards in another work of the mathematical kind, in which he included Les Sertiones Coniques, les Lieux Gesnctrigues, la Confrution des Equations, et Une Theorie des Courbes Mecbaniques: but a little before he had finifted it, he was feized with a fever, of which he died Feb. 2. 1704, aged 43. It was publifhed after his death.

HOSPITALITY, the pratice of entertaining Arangers. Dr Robertion, fpaking of the middle ages, fays, "Among people whofe manners are fimple, and who are feldom vifted by frangers, hofpitality is a virtue of the firt rank. This duty of hofpitality was fo neceflary in that fate of fociety which took place during the middle ages, that it was not conlidered as one of thofe virtues which men may practife or not, according to the temper of their minds and the generolity of their hearts. Hofritality was enforced by flatutes, and thofe who neglected the duty were liable

Infrita- to punifimen: The laws of the Shavi ordained that liry. the moveables of an inhofpitable perfon fheuld be confifcated, and his houle burnt. 'They were even fo folicitons for the entertainment of ftrangers, that they peranited the landord to fteal for the fupport of his gueft."

Thee hofpitality of our Britifh ancettors, particularly of the great and opulent barons, hath been much admired, and confidered as a certain proof of the noblenefs and generolity of their fpirits. The fact is well attefted. The eathes of the puwerful barons ware capacious palaees, daily crowded with their numerous retainers, who were always welcome to their plentifnl tables. They liad their privy counfeilors, their treafurers, marftals, corftables, flewards, fecretaries, chapIains, licralds, purfuivants, pages, hemhmen or guards, trumpeters, mintirels, and in a word all the officers of a royal ecurt. The etiquette of their families was an exact copy of that of the royal houfthold; and fone of them lived in a degree of pomp and fplencor little inferior to that of the geatef kings. Richard Nerille, earl of W"arwick, we are told, "was ever had in great lavour of the commons of the land, becauie of the execcling houfchold which he daily kept in all cous. tries wherever he fojourned or lay: and when he came to London, be held fuch an houfe, that fix oxen were eaten at a breakfall; and every tavern was full of his meat." 'The earls of Douglas in Scetland, befure the fall of that great family, rivalled or rather exceeded their fovereigns in pomp and profufe hofpitality. But to this manner of living, it is highly probable thefe great chieftans were prompted by a detire of increafing the number and attachment of their retainers, on which, in thofe turbulent times, their dignity, and tven their fafety, depended, as much as to the innate genesofity of thein tempers. Thufe retainers did not ennlantly refide in the families of their lords; butt they wote their liveries and baiges. frequently fealted in their halls, fweiled their retmues on all great ©olemnities, atmended them in their jountoys, and followed them inio the fold uf batie. Some powerful chieftuins had fogerat a number of thefe retainers conthants Iy at their command, that they fet the laws at defiance, wieformidabie to the ir fovereigros, ard terrible tu their fellow fibjects; and feverallews wete made againt giving and receiving liveries. But thefo Jaws produced litele effect in thes period.

Hofpitality was not confined to the gicat and opulent, but was practiod rather more than it is at preLent by pertens in the midetle an I lower ranks of hife. Put this was owing to neceflity, arifing from the fearcity of inns, which obliged travellers and trangers to apply to private perfons for luedging and entertainment; and thofe who receised them lofoitatly arquind a right to a fimilar recestion. This was cridently the cale in Scotland in the fia part of this period. James I. A. D. 1424 , procured the fullowing act of parliament. "It is ordanit, That in all hurrow townis, and throuchfairis qubair commoun palfages at, that thair be ordanit holfillaijes and refetcis, havand tlables and chalmers; and that men find with thame bread and aill, and all uther fide, alfueil for horfe as men, for refonabte price." But travellers had betn folong accuftomed to ladge in private houles, that thefe publie inns were quite ncollected; and thofe who bept

Vol. VII. Dert 1 .
them prefented a petition to parliament, complaining, Hompitai. "That the liegis travelland in the realme, quhen they com to burrowis and throuchfaisis, herbreis thame not in hofillaries, bet with thair aequaintance endfriendis." Theis produced an act prohibiting travellers to lodge in private houfs where there were huftalies, under the penalty of 40 s . and fubjecting thofe who lodged them to the fame penalty.

The inhabitants of the I ligluands and the Weftern Incs were remarkalle for the ir hofpicality and kindnefs to fliangers, and ilill retain the fame difpofition. Sce Highlanders.

HOSPITALI.ERS, Hospirazarat, an order of religious knights, who built an hofpital at Jerufalen, wherein pilgrims were received. To thefe pope Clement $V$. transferred the effects and revennes of the Templars; whum, by a council held at Vienne, he fapprefled for their many and great mifderneanours. Thefe hofpitallers were ctherwife called Krighes of St Joln of Jerufolem; and are the fare with thofe whom we now call Kuights of Mafta.

HOSPITIUM, a term ufed in uld writers either for an inn or a monaltery, built for the reception of fran. gers and eravellers. Sce Isn and Monastery.

HOSPODAk, a title borne by the prinees of Walachia and Moldavia, who receive the itveltiture of their principalities from the grand fignior. He gises them a velt and flandard; they are under his protcicion, and obliged to ferve him, and lie even fometimes depoles them; but in othes reffects they are abfome fovereigns within their own duminions.

HOST, hospes, a term of mutual rclation, applied both to a perfon who lofiges and entertains another, and to the perfon thus lodged, s.c. - The word is formed of the Latin hoffes, which forne will have thus called, guals haium or ofium potcts; fur o. Tisan was anciently writun with an afpirate. - Thus the innkecper fays. he las a good bof, in fpeaking of the trasiller wio lodges with him: and the iraveller, agrain, foys, he kas a kind ley, in fpeakirg of his landlord.

It mult te obferved then, that it was the cultem among the ancionts, when any Aranger aflice for luc. ging, for the mafter of the houle, and the franger, rach of thems to fet a foot on their own fide of the threfhold, and fwear they wotld neither of them do any harm tu the other. It was this ceremony that raifed to much harror againt llafe who violated the Jaw or right of hofpitality on either fice ; inafnuch as they were looked on as periured.

Inflead of boghes, the anciont Latins called it lofis ; as Ciccro himiclf informs us: though, in courle of time, hoffis came to fignify an enemy; fo much was the notion of hofpitality alcercel.

Host is allo ufed by way of abbreviation for bopia, a vietim or facrifice ofered to the Deity. In this fenfe, bofl is mure inmediately underfluod of the perfon of the Word incarnate, who was offered up an holt ur lighitia to the lather on the crofs for the fins of mankind. Sce liostia.

Host, in the clurch of Fome, a name given to the elements ured in the eucharif, or rather to the conferated wafer: which they pretend to effer up every day a nes holl or lacrifice for the fans of man-kind.- They pay adoration to the hoft, upon a falfe

4 pre-
prefumption that the eiements are no longer bread and wine, but tranfubllantiated into the real body and blood of Chifif. See Transubstantiation.-Pope Gregory IX. firlt deeretd a bell to be rung, as the fignal Ir the people to betake themfelves to the adoration of thec hoge...The veffll wherem the hofls are kept is called the cibsery; being a large kind of covered chalice.

Hosildobe, a perfon given up to an enemy as a lecum: for the performance of the articles of a treaty.

Hos l'1A, Host, in antiquity, a victim offered in facruice to a deity.

The word is formed from bofis, "enemy;" it being the coblen to oflit up a facrifice before they joined bath, to render the gods propitious; or, after the batele was over, to give them thanks. Some choofe to derive the word from boffio, q. d. ferio, "I Prike." Itidore on this word remarks, that the name boffir was given to thofe facrifices which they offerd before they marched to attack an enemy, (antequam ad bogem pergerent); it contraditivetion from viatinu, what wire properly thofe offered after the vietory.

Hoflia alio lignified the leffer forts of facrifice, and vigima the lay ger. A. Gellius fays, that every prief, indifferently, might facrifice the bofia, but that the victima could be offered by none but the conqueror himfelf. But, after all, we find thefe two words promifcuounly ufed one for the other by ancient writers. We read of many kinds of hofir: as hofice pure, which were pigs or lambs ten days old; boffix. pracithnee, facrifiecs offered the day before a folemn featt; boflic bidentes, facrifices of theep or other aninals of two years old; hoplix crimis, a facritice of the flower of the flock; boflis fuccedmert, facrifices offered after others which had exhibited fome ill omen; bofise amburvales, victims faerificed after having been folemnly led round the fields at the amparvalia; lyflia amlurtiales, victims flain after the amburtium; boiflie caneares or curdiares, victims facrificed every liftli year by the college of pontiffs, in Which they offered the patt of the tail called caviar; 2, ita frot tick Sacrifices in which the fire confumed all, and left nuthing for the priells; hoflie piaculares, expiatory facrifices; buflix amberne or ambiegna, facrifices of cows or hleep that had brought forth twins; bollix larrug.e, victims ofiered to predict future events from; Ponite medictes, black victims officed at noon.

HOSTILITY, the action of an enemy, or a flate of warfare. The word is Latin, hymbilitas, formed of the primitive bofis, which fignifies "enemy;" and which ancieutly lignilied "Itranger," loopes.

HOT-beds, in gardening, beds made with frefh borfe-dung, or tanner's bark, and covered with glafles to defend them from cold winds.

By the Rkilful management of hot-beds, we may imitate the temperature of warmer climates; by which means, the feeds of plants brought from any of the countries within the torrid zone may be made to Ilourith even under the poks.
'The hot-beds commonly wfed in kitchen-gardens, are made with new hurfe dung mixed with the litter of a tlable, and a few fea coal-athes, which latt are of fervice in coutanuing the heat of the dung. This thould temain fix or feven days in a heap; and being then turned over, and the parts mixed well together, it fhould be argain call into is heap; where it may continue five or lix days longer, by which time it will
have acquired a due heat. Thefe hot-heds are made in the following manacr: In fome fheltered part of the garden, dig out a trench of a length and width proportionable to the frames you intend it for; and if the ground be dry, about a foot or a foot and a half deep; but if it be wet, not above fix inches: then wheel the dung into the opening, obferving to ftir every part of it with a fork, and to lay it exacity even and finooth on every part of the bed, laving the buttom part of the heap, which is commonly free from litter, upon the furface of the bed: and if it be defigned for a bed to plant out cucumbers to remain for good, you mutt make a hole in the middle of the place defigned for each light about ten inches over, and fix deep, which fhould be filled with good frelh earth, thrulling in a ftick to thow the places where the holes are; then cover the bed all over with the earth that was taken out of the trench, about four inches thick, and put on the frame, letting it remain till the earth be warm, which commonly happens in three or four days after the bed is made, and then the plants may be placed in it. But if your hot bed be doligned for other plants, there need be no holes made in the dung; but after having fmoothed the furface with a fande, you fhould cover the dung about three or four inches thick with good earth, putting on the frames and glaffes as before. In making thefe beds, care mult be taken to fettle the dung clofe witha fork; and if it be pretty full of long litter, it fhould be trod down equally on every part. Daring the firit week or ten days after the bed is made, you fhould cover the glaffes but flightly in the night, and in the day-time carefully raife them, to let out the feam: but as the leat abates, the covering fhould be increafed; and as the bed grows cold, new hot dung fhould be added round the fides of it.

The hot-hed made with tanner's bark is, however, much preterable to that deferibed above, efjecially for all tender exotic plants and fruits, which require an even degree of wannth to be continued for feveral months, which cannot be effeted with horfe-dung. The manner of making them is as fullows: Dig a crench about three fut deep, if the ground be dry; but if wet, it mult not be above a foot dee: at molt, and mult be raifed two feet above the gromind. The length mutt be propartioned to the frames intended to cover it ; but it thould never be lefs than ten or twelve fect, and the width not lefs than fix. The trench flould be bricked ap round the fides to the abovementioned height of three fect, and filled in the fpring. with freth tanner's bark that has been lately drawn out of their vats, and has lain in a round heap, for. the moiture to drain out of it, only three or four days: as it is put in, gently beat it down equally. with a dung. fork; but it mult not be trodden, which would prevent its heating, by fetting it too clofe: then put on the frame, covering it with glaffes; and in about ten days or a fortnight it will begin to heat; at which time plange your pots of plants or feed inta. it, oblerving not to tread down the bark in doing it. 'r'hefe beds will continue three or four months in a grood temper of hest; and if you thir up the bark pretty decp, and mix a load or two of frefl bark with the old when you find the warmth decline, you will preferve its heat two or blrec months longer. Many

Hotel lay fome hot horfe-dung in the bottom of the trench under the bark; but this ought never to be practifed unlefs the bed is wanted fooner than the bark would heat of itfclf, and even then there ought only to be a fmall quantity of dung at the bottom.

The frames which cover thefe beds, fhould be proportioned to the feveral plants they are defigned to contain. If they are to cover the ananas or pineapple, tbe back part flould be three feet high, and the lower part 15 inches: if the bed be intended for taller plants, the frame mult be made of a depth proportionable to them: but if it be for fowing of feeds, the frame need not be above $1+$ inches high at the back, and 7 in the front; by which means the heat will be much greater.

Hot Houfe. Sce Stove and Hypocaustum.
HOTEL, a Frencl term, anciently lignifying a houfe or dwelling place. - It is now more commonly ufed for the palaces or houfes of the king, princes, and great lords. In this fenfe they fay, the boted de Conde, botel de Conti, botel du Louvere, \&c.

The grand prevot de l'lotel, is the firft judge of the officers of the king's houfehold. His juifdiction is much like that of lord tleward of the houfehold of the king of England.

The sted de ville is what we call a toum-boufe or rown-ball.

Нотel, is likewife ufed for a large inn, alfo for a large lodging-houfe ready furnifhed.

HOTMAN (Francis), one of the mofl learned civilians in the toth century. He profeffed law at Bourges: but, on account of religion, retired to Geneva, read lectures on civil law there, and publifhed books with fuch ftrength againft the perfecutors, that great promifes were made to him to engage him not to write any more in that manner; but he did not regard their offers. He died at Bafil in 1590. His Franco-Galla is well known, having been done in Englifh by lord Molefworth. Some perfons think he was the author of Vindicizizontra Tyrannos. All his works were printed at Geneva in 1590 , in 3 vols folio.

HOTTENTOTS, a people in the fouthern part of Africa, whofe country fursunds the empire of Alonomotapa, in form of a horfe-fhoe, extending, according to Magin, from the Negroelt of Cabo as far as the Cape of Good Hope; and from thence northward to the river Magnica, or Kio de St Spirita, including Mattatan a dittinct kingdom. According to Sanutus, this coaft, beginning at the Mountains of the Moon under the tropic of Capricorn in $23^{\frac{1}{8}}$ S. Lat. extends north beyond the Cape to the coalt of Zanguebar; having the Indian fea on the eaft, the Ethiopic on the welt, the fouthern occan on the fouth; and on the north the kingdoms of Mattatan, Monomotapa, and the coalt of Zanguebar, or rather the Mountains of the Moon, which divide it from the reft of the continent.

The Europeans firf became acquainted with this country in the year 1493, when Bartholomew Diaz, a Portuguefe admural, dificovered the noolt foutherly point of Africa now called the Cape of Guod Hope but by him Calo dos totos tormentos, or Caye of all Plagues, on account of the forms lie met with ill the neighbourhood; but Jobn, then king of Purtugal, ha.
ving from the account of Diaz concluded that a paf. Hotentots. fage to the Eaft Incies was now difcovered, changed the name to that of the Cap: of Gond Hope, which it Alll retains. In 1497, it was circumnavigated by Gafco de Gama, who made a voyage to India that way; ho sever, it remained ufelefis to Europeans till the year 1650, when Van Riebeck a Dutch furgeon firt faw the advantages that would acerue to the Eaft India company in Holland frum a fettement at fuch a convenient ditance both from home and from India. The colony which be planted has ever fince continued in the hands of the Dutch, has greatly increafed in value, and is vifited by all the European Chips trading to the Eaft indies. See Goon Hopre.

The country now paffeffed by the Dutch is of pretty confiderable extent, and comprehends that part of the African coall on the welt called Terra de Niztal. It is naturally barren and mountainous; but the indultry of the Dutch hath overcome all natural difficulties, and it now produces not only a fufficiency of all the neceffaries of life for the inhabitants, but alfo for the refrefhment of all the Europeans who pals and repais that way.

The coait abounds in capes, bays, and roadz. Thirty leagues to the eaft of the Capz of Grod Hope, in S. Lat. 34. 21. is another Cape which runs out beyond $35^{\circ}$, called by the Portagnefe, who firit doubled it, Cabo dos Agullas, or the Cape of Needlis, on account of fome tlrange variations in the magnetical needle obferved as they came near it. Near this Cape is a flat thore, with plenty of fith: it begius in the wett near a frefh-water river, and, extending 15 leagucs in the main fea, ends in the eaft near Fijbllay. Cabo Falfo, fo called by the Porturguefe, who returning from India mittook it for the Cape of Good Hope, lies to the eaftward between thefe two capes, about eight or nine leagues beyond that of Good Hope. Along the coalts, on both fides of the Cape of Good Hope, are many fine bays. Twenty-fevell leagues to the northweft is Saldonla bay, fo named from a Portuguefo captain flipwrecked oa the coalt. The largett and molt commodious is Table Bay, on the touth, and near the mountain of that nance, tix leagues in circum'erence, with four- fathom water clofe to the beach. Opporlite to this bay is Robu Eilan, or the illand of Rabbits, in 34. 30. S. Lat. 67 leagues ealt from the Cape of Good Hope. Peter Both, in 1651 , diforeted a bay, which he named Ulefh, theltered only from north winds, in which is a fmall ifland, and on the well a rivulet of freth water extremely convenient for European mariuers. T'wenty-five or thirty leagues farther eall, buth difcovered Marfhal Bay, afterwards named by the Portuguefe Seno Formofo. Next to this is Seno de Ladgo, from its refemblance to a lake. There are feverat roads in this hay, and an illand called Ilba dos Cays. Cabo de S. Francifoo, and Cabo das Scrras are mark. ed upon charts between thefe two bays. Niar the lattor of there capes is Cabo de Arecito, and the ifland Contento; and fomething more nur:h.calk is St Chriltopher's river, called San Chriflovano by the Portuguefe, and by the Hottentors Nagod The country. beyond this river was called by the Purtuguefe, who difcovered it on the day of our Lurd's nativity, Torra de Natal. Between the Cape uF Good Hope and Cabo das Agulhas are the Sweet,
thotenor. Salt, and Jagulina rivers, whicis ma into the fea, and Sweet-water river flows trons the 「abie mountain.

The rast remarkable montans in this comery are, 'Tablemonain, Devil's 'l'ower, Lion's Head, and the tieger hals. Tlice three lift lic near Tablebey, and furromal Tabicevalhey, where the Cape town hands. (Secthe areicle Gom-Hoper) Mr Forlter, in his syare, informs la, that "the eatremiey of Africa towath the fouth is a mats of himh montains, of which the outermoll we cray y. black, and hatren, confiting of a coaric branice, whith outains to heterngeneas prits, fich as Irtifat thel.s, Sc. wor any whantic productions. The ground gradualy rifes on a.l fides towands the three foumtains which lie romat the bercom of the biy, keeparg how and level only near the fia fide, and grawing furnwhat marthy in the Ithmus betwen Falk and Tuble Bays, where a falt rivulet falls into the lastor. The mathy part has fome verdure, but intermixed with a great deal of fand. The higher grounds, which, from the fea-lide, have a parched and dreary appearance, are, however, covered with an immenfe varicty of plants, anong which are a prodigions number of hanbs, but farce one or two fpecies that deferse the name of trees. There are alfo a lew fanall plansations aberever a little run of water moinens the gromal. The afcent of Table-momat is very teep and cifficult, on account of the number of loofe thones whith roll away ander the feet of the traveller. About the midlle of the mountain is a bold, grand chatu, whole walls are perpendicular, and often impending rocks piled up in ftrata. Small rills of water ooze out of crevices, or fall from precipices in drops, giving life to hundreds of plants and low Arubs in the chafm. The fummit of the mountain is nearly level, very barren, and bare of foil; feveral cavities, however, are filled with rain water, or contain a fmall quantity of vegetable earth, from whence a few oduriferous plants draw their nouriflment. Some antelopes, huwling baboone, folitary vultures, and inals, are furnetimes tu be met with on the molutain. The view from thence is very extentive and picturefque. Tle bay feems a fmall pond or bafon, and the flips in it dwinded to little boats; the town under our feet, and the regular compartments of its gardens, look like the work of children."

Mult accounts of this country that have been publiffudmention a furprifing phenomenon which is anaually to be feen on the top of Table-hill from September to March: namely, a white cloud hovering on its top, and called by failurs the Deril's stable-cioth. (See the article Goon-Hope.) This cloud is faid by fome to appear at firf no bigger than a barley-corn; then increafes to the fize of a walmut, and foon after covers the whele top of the mount. But, according to Mr Kolben, it is never lefs, even on its firf appearancer, than the fize of a large ox, often bigger. It hangs in feveral fleeces over the Trable-hill and the Wind or Devil's till ; which fleeces, at latt uniting, form a large cloud that covers the fummits of thefe two hills. After this has retled for fome time without change or motion, the wind burfts out fuddenly from it with the utmolt fury. The fkirts of the cloud are white, but feem much more compact than the matter of common clouds; the upper parts are of a leaden colour. No rain falls from it, but fometimes it dif.
covers a great deal of humidity; at which times it is Hotente of a darker colour, and the wind ifluing, from is is broken, raging by fits of thort contimuance. In its ufual thate, the wind keeps up its firft fury unabated for one, two, three, or cight days; and fometimes for a whole month together. The cloud feems all the while undimiuined. theugh little fleces are frum time to time detached from it, and hurried down the fodes of the hills, vanifhing when they reach the bottum, fo that during the florm the clond feems to be fupplied with new matter. Whon the cloud begius to bigliten up, thefe rupplies fail, and the wind proportionably abates. At length, the clond growing atanparent, the wind ceafes. During the continuance of thele foutheall winds, the Gable valley is torn hy furious whirtwimes. If they Llow warm, they are generally of thort daration; and in this cafe the dout toon dilappears. This wind rarely blows sill after fonfet, and uever longer than till towards midnight, though the cloud remains; but then it is thin and ckar: but when the wind blows cold, it is a fuec lign that it will lail for fone time, an bour at noon and midnight excepted; when it iems to lie fill to recover itfelf, and then lets loofe its fury anew.

The Enropeans at the Cape confider the year as divided into two feafons, which they term mon, ans. The wet monfoon or winter, and the dry one or fummer. The firt berins with our fpring in March ; the latter with September, when our fummer ends. In the fummer monfuon reign the fouth ealt winds already mentioned; which, though they clear and rencicr the air more healthy, yet make it difficule for thips outward tound to enter Table-bay. In the bad feafon, the Cape is much fubject to fogs; and the north-weit winds and rain make the inhabitants flay much at home. But there are frequent interififions and many clear days till June and july; when it rains almolt continually, and from thence till fummer. The weather in winter is cold, raw, and unpleafant; but never more rigorous than autumn in Germany. Water never freezes to above the thicknefs of half a crown; and as foon as the fun appears, the ice is diflolved. The Cape is rarely vilited by thunder and lighetring, excepting a little near the turn of the feafons, which nevet coes any hurt. During the continuance of the fouth-ealt winds which rage in fummer, the 作y is free of all clouds except that on the Table and Wind Hills alieady mentioned; but during the north-welt winds, the air is thick, and loaded with heavy clonds lig with rain. If the fouth-eatt winds thould ceafe for any length of time, the air becomes fickly by reafon of the fea-weeds driving afhore and rotting; hence the Europeans are at fuch times affiected with head-achs and other dioforders: but, on the other hand, the violence of thofe winds fubjects them to inflammations of their eyes, \&c.

The natives of this country are called Huttentots, in their own language ; a word of which it is vain to inquire the meaning, fruce the language of this country can fcarce be jearned by any other nation. The Hottentot language is indeed faid to be a compofition of the molt frange aud difagreeable founds, deemed by many the difgrace of fpeech, withont luman found or atticulation, refembling sather the noife of irritated turkies, the chattering of magpies, hooting of owls, and

## $\mathrm{H} \quad \mathrm{O} \quad \mathrm{T}$

entota depending on extraordiaary vibrations, inflexions, and clathings of the tongue againtt the palate.-If this ac. count is thue, however, it is obrions, that all the relations we have concerning the religion, \& E . of the Hottentots derived from themfelves, muth fail to the ground, as nobody cain pretend to uadertand a language in itfelf unintelligible. The manners and cudioms of thofe people, however, are ealily obfervable, whether they themfelves give the relation or unt; and if their language is conformable to them, it is no doubt of a nature fufficienti?' woaderful.

Many accounts have been publimed eoncerning the extreme nallinefs and tilhy cuftoms of the Hottentats; but from the obfervations of late travellers it appears, that thefe have either been exaggerated, or that the Hottentuts (which is not improbable) have in forme meafute laid afide their former inanners. 1)r Sparrmen defcribes them in much lefs difguifful terme, and M. Vaillant feems to have been charmed with their innocence and fimplicity. According to the Doctor, thefe people are as tall as the generality of Europeaas, though more flender in their perfons, which he attributes to their feanty fupply of food, and not acculloming themfelves to hard labour. The charafterific of the nation, however, and which he thinks has not been obferved by any one before, is, that they lave fmall lian's and feet in proportion to the other parts of their body. The diflance between the eyes arpears greater than in Europeans, by reafon of the root of the nofe being very low. The tip is pretty flat, and the iris of the eye has generally a dauk-brnw in cat, fometimes approaching to black. Their $\mathbb{k}$ in is of a yellowifh brown, fomething like that of an European who has the jaundice in a bigh degree ; though this colour does not in the lealt appear in the whites of the eyes. Their lips are thinner than thofe of their neighbours the Negroes, Caffies, or MIosambiques. "In fine (fays our author) their mouths are of a middling fize, and almoft alxays furnithed with a fet of the tinelt teeth that can be feen; and, taken together with the reft of their features, as well as their carriage, hape, and every motion, in fhort their tout anfimble indicates health and delight, or at leaft 20 air of fans fouci. This carelefs mien, however, difonvers marks at the fame time both of alacrity and refolution; qualities which the Hottentots, in fact, can how upon necafion." The hair of the head is black and frizaled, though not very clofe; and has fo much the appearance of wool, that it would be taken for it, were it not for its harflnefs. They have but foldom any appearance of a beard, or hair upon other parts of their bodies; and when any thing of this kind happens to be vifible, it is aluay very night.
A general opinion has prevailed, that the Hottentot women have a kind of natural wail which covers the fexual parts; but this is denied by our author. "The women (fays he) bave no parts uncommon to the reft of their fex : but the clitoris and nympher, particulaly of thofe utio are pa!t their youth, are pretty much elongated ; a peculiarity which has undoubtedly got fonting in this nation in confequence of the relaxation neceffarily produced by the method they have of befmearing their bodies, their Rothfulnefs, and the warmth of the climate."
The Hotentots befinear all their bodics copionfy
with $f_{\text {at }}$ mixed up with a little foot. "This (fags Hottentotso our author) is never wiped uff; on the contrary, I never faw them ufe any thing tu clean their fkins, excepting that when in greafing the wheels of their waygons, their hands were befmeared with tar and pitch, they ufed to get it off very eatily with cow-dung, at the fame time rubbing their arms into the bargain up to the fhoulders with this cofmetic; fo that as the duft and other filth, together with their footy oinement, and the fweat of their bodies, mult necerfarily, notwithfanding it is continually wearing off, in fome meafure adhere to the fkin, it contributes not a lithe to conceal the natural hue of the latter, and at the fame time to change it from a bright umber brown to a brownibh-gellow colour, obfcured with filth and naAtinefs." - The DaEtor was enabled to difeover the natoral colour of the Hostentots by means of the ricesty of fome Dutch farmers wives, who had mate their Hottentot girls wath and foour their fins, that they might be lefs filthy in looking after the children, or dning any nther work that required eleanlineifs. Many of the colonitts, however, are of opinion, that this opperation of walhiog is no improvement to the look of an Hottentat; but that their natural yellow is fully as difagreeable as the black or brown colour of the oiniment; and that the wathed !kin of a native of this come try feems to be deficient in drefs, like thoes that want blacking. This the Duetor dues not pretend to de. termine; though, whatever may be luppofed deficient in look we fhould think, mut be made up in cleanlinefs.

The Hottentots perfume their bodies, by daubing them all over with the powder of an herb, the finell of which is at once rank and aromatic, appruaching to that of the poppy mixed with ipices. For this purpofe they we various ipecies of the diofma, called by them bucku, and which they imagine to be very efficacious in the cure of diforders. One 位cies of this plant, growing about Goud's yivier, is faid to be fo valuable, that no more than a thimble.full of its powder is given in ex. change for a lamb.

By the ointment of foot and gre?fe ruck full ce the powder of buchu, a patte is forned which defonds the bodies of the Hottentots in a great meafure from the action of the air ; So that they require very few clothes, and in fact go aimolt quite maked. The only covering of the men confills of two leather Mraps, which generally hang down the back from the chine to the thighs, each of them in the form of an ifolicles triargle, their points uppermoff, and fallened to a beit which goes round their wafe, their baits not beill: above three fingers broad; fo that the covering they form is extremely trifing. Thefe traps have very little dreffing beftowed upon them, fo that they make a rattling noife as the Hutentot rums along; and our anthor fuppofes that they may produce an agreeable coninef 3 by fanning lim. Befides this, the men have a bag or flap made of tkin which hangs down before, and is faftened to the belt already mentioned. The hollow part of this feems defigned to receive that which with us modefty requires to be concealed; but being only faltened by a fmall part of its upper end to a narraw bels, in other refpects hancing guite loofe, it is but a very imperfect concealment; and when the wearer is walking, or otherwife in motion, it is none at all. They

Hotertots call this purfe by the Dutch name of gackall, it being almoft always prepared of the kin of that animal, with the hairy bide turned outwards.

The women cover themfelves much more fcrupulouny than the men, having alwaystwo, and very often three coverings like aprous; though even thefe feem to be abundantly fmall fur what we would term decency in this country. 'The outermolt of thefe, which is the largent, meafures only from abont fix inches to a foot in breadth. All of them are made of a flin well prepared and greafed, the outermott being adorned with glafs beads ftrung in different figures. The outermof reaches about half-way down the thighs, the middle about a third, or one half lefs, and the third fearcely excerds the breacth of the hand. The firt is faid to be defigned for ornament, the fecond as a defence for modetly, and the third to be ufeful on certain occafions, which, however, are much lefs troublefome to the Hottentot than to the European females. Our author, with great probability fuppofes, that it was the light of this innermolt apron which mifled the reverend Je. iuit Tackard, who, on his return to Europe, tirt propagated the Atolies concerning the natural vails or exclefeences of the Hottentots. $-A$ fory was likewife commonly beliewed, that the men in general had but wne teiticle, and that fuch as were not naturally formed in this manner were artificially made fo. But this our author likewife denies; and though he fays that fuch an operation might have been formerly performed upon the males, yet it is not fo now.

The other garments worn by the Hottentots are formed of a fheep's-fkin with the woolly fide turned inwards; this forming a kind of cloak, which is tied forwards over the breat: though fometimes, infted of a fheep's-flin, fome fmaller kind of fur is nfed as a material. In warm weather they let this cloak hang careld foly over their thoulders, fo that it reaches down 10 the calves of the legs, leaving the lower pant of the brealt, Aomach, and fore part of the legs and thighs hare; but in cold weather they wrap it round them: to ther the fore part of the body is likewife pretty well corered by it as lat as the knees: But as one Mreep-fin is not fufficient for this purpufe, they few on a piece on the top at each fide with a thong or eatgut. In warm weather they fometines wear the woolly lide outwards, but more frequently take off the chaik altoge. ther, and carry it under their arm. This cloak or kroffe forves them not only for clothes, but bedding atto ; and in this they lie on the bare ground, drawing up their bodics fo ctole, that the cloak is abundantly fufficient to cover them - The cloaks ufed by the wonen differ little from thefe already deferibed, excepting only that they have a long peak on them, which they turn up; forming with is a little hood or pouch, with the hairy fide inwards. In this they carsy their little children to which the mother's breafts are now and then thrown over the fhoulders; a cullom common among fome other wations, whare the bualts of the females, by continaal want of fupport, grow to an enormous length. The men commonly war no coveing on their heads, though our author fays he has feen one or two who wore a greafy night-cap mace of fkin with the hair taken wf. 'Thofe who live nearell the colonilts have taken a liking to the European hats, and wear them flumbed all soand, or with unly one dide turnca
up. 'The women allo frequently go bare headed; Ho:te though they fometimes wear a cap made in the hape of a thort truncated cone. This appears to be the fection of tome animal's tomach, and is perfectly blacked by foot and fat mixed up together. Thefe caps are frequently prepared in fuch a manuer as to look thaggy; others have the appearance of velvet; and in our auther's appearance are not inelegant. Over this they fometimes wear an oval wreath or kind of crown made of a buffaloe's hide, with the hair outermoft. It is about four fingers breadth in height, and furrounds the head fo as to go a little way down upon the forchead, and the fame depth on the neck behind, without covering the upper part of the cap above deferibed. 'The edges of this wreath, both upper and under, are always fmooth and even; each of them fet with a row of fimall thells of the cyprea kind, to the number of more than 30 , in fuch a manner, that, being placed quite clofe to one another, their beautiful white enamel, together with their months, are turned ontwards. Between two rows of thefe thells run two others parallel, or clfe waved and indmited in various ways. The Hottentots never adorn their ears or nofes as other favages do: though the hatter are fometimes marked with a black itreak of font; at others, though more rarely, with a large fot of red lead; of which latt, on foltivals and holidays, they likewife put a little on their cheeks. The necks of the men are bare, but thofe of the women are ornamented with a thong of undreffed leather, upon which are ttrung eight or ten thells. 'Thefe, which are about the fize of beans, have a white ground, with large black fpots of different lizes: but as they are always made ufe of in a burnifhed ftate, the Doctor is uncertain whether they be of that kind which is teceived in the Syftema Nature under the name of nirita albicillu, or exuvia. Thele thello are fild at an enormous price, no lefs than a fheep for each; as it is fand that they come from the moll dilant cualt of Caffraria. Both men and women are ve:y fund of European beads, particularly the blue and white ones of the fize of a pea; of which they tie feveral tows round the middle, and next to the girdles which hold the coverings above mentioned. Befides thefe ornaments, they ufe rings on their arms and legs; molt of them made of thick leather ftraps generally cut in a circuiar thape; which, by being beat and helet over the fire, are rendered tough enough to retain the curvature that is given them. Fiom thefe rings it las been alnoft univerfally believed, that the Hottentots wrap guts abour their legs in order to eat them occafionally. The men wear from one to five or fix of thefe rings on their auns, juft above the wrift, but feldom on their legs. 'The matrons of a higher rank have frequently a confiderable number of them both on their arms and legs, efpecially on the latter; fo that they are $c$ veteo whth them from the feet up to the knees. Thefe riags are of varous thickneffes, from that of a grofe quill to two of three times that fize. Sumetimes they are made of pieces of leather forming one ontire ring ; fo that the arms aud feet mutt be put though thim when the wearer wifhes to put them on. They are itsung upon the legs, fmall and great, without any nicety; but are folace, that they thake and get twifled when the perfon walls Rings of iron or copper, but efuecially of biafs, of the tize of a

## H O T

atots. goofe-quill, are cont res is more genteel than thofe of leather. Howev-1, th: y are fometimes worn along with the latter, to the number of fix or eipht at a time, particuiarly on the arms. The girts are not allowed to ufe any rings till they are marriageable. The Hottentots didom xear any floes; hut fuch as they do make ufe of are of the fame firm with thofe worn by the African peafants, by the Elthonians, and Livonians, as well as by fume Finlanders; fo that it is impofible to fay whether they are the invention of the Dutch or the Hiottentots themblues. They are made of undreffed leather, with the hairy lide outward; without any other preparation than that of being beat and moiltened. If it be a thick and ftont hide, as that of a buflatoe, it is kept for fome hours in cowdung, which renders it befides very foft and pliable. Some kind of greafe is afterwards ufed for the fame purpofe. The thoes are then made in the following manner. They take a picce of leather, of a rećtangular form, fomething longer and broader than the foot of the perion for whon the fhoes are intended; the two foremoft corners are doubled up together, and fowed down, fo as to cover the fore-part of the foot; but this feam may be avoided, and the fhoes made much neater at the toes, by fitting immediately over them a cap taken from the membrane in the knee-joint of the hind leg of fome animal. In order to make this piece of nkin or leather rife up to the height of an inct on both fides of the foos, and clofe it in neatly, it is pierced with holes at fmall diftances all reund the edge, as far as the hind quarters; and through thefe holes is paffed a thong, by which the rim is drawn up into gathers. In order to make ftrong hind quarters, the back part of the picce of leather is doubled inwards, and then raifed up and prefled along the heel. The ends of the thong or gathering flring are then threaded on both fides through the upper edge of the bindquarters, to the height of about two inches; they are then carried forwards, in order to be drawn through two of the above-mentioned holes on the infide of each rim. Lafly, they are tied over the inftep, or if it be thought neceflary to tic the floe dill faller, they are carried crofs-ways over the inftep, and fo downwards under the thong, which comes out from the hind-quarters; then upwards again over the ancle, and even round the leg itfelf if the wearer choofes. Shoes of this kind are not without their advantages: they fit as neat upon the foot as a flocking, and at the fame time preferve their form. They are eafily kept foft and pliable by confantly wearing them; or, if at any time they thould become fomewhat hard, this is cafily remedied by beating and greaing them. They are extremely light and cool, by reafon that they do not cover fo much of the foot as a common thoe. They wear very well, as they are without any leam, and the foles of the fhoes are both tough and yielding. Thefe field fhoes, as they are called, being made of almolt taw leather, are much more durable than thofe of tanned leather, which are burnt up by the A frican fands, and llip and roll about in them; being alfo very ready to be torn in a rocky foil, which is not the cafe with the others. The Doctnr is of opinion, that thefe fhoes would be particularly ufeful to faitors.

The huts of the Hottentcte are built exactly alike; and we may readily give cledit to cur author when he
tells us, that they are done in a ftyle of architecture Ho:tentots. which does not a little contribute to keep envy from infinuating itfelf under their roofs. Some of thefe huts are circular, and others of an oblong fhape, refembling a ruund bee-hive or vault; the ground plot being from 18 to 24 feet in diameter. The hizhelt are fo low, that ir is fearce ever poffible for a middle.fized man to fland upright even in the centre of the atch; "but (fays our author) neither the lownefs thereof, nor that of the door, which is but jull three fect high, can perhaps be confdered as any inconvenience to an Hottentot, whotinds no difficulty in flooping and crawling upon all fours, and is at any time more inclined to lie down than to ftand. The fire-place is in the midule of each hut, hy which means the walls are not fo much expofed to danger from fire. From this fituation of the fire-place alfo the Hottentots derive this additional advantage, that they can all fit or lie in a circle round it, enjoying equally the warnth of the fire. The door, low as it is, alone lets in day. light or lets ont the fmoke: and fo much are thefe perple accuftomed to live in fuch fmoky manfions, that their eyes are never affected by it in the leath, nor even by the mephitic vapour of the fuel, which to Europeans would be certain death.

The frame of the arched roof is compofed of nender rods or fprays of trees. Thefe being previonily bent into a proper form, are laid, either whole or pieced, fome parallel to one another, others crofswife; after which they are Arengtliened by binding others round them in a circular form with withics. All thefe are taken principally from the clifortia conoides. which grows plentifully in this country near the rivers. Large mats are then placed very neatly over this lattice work, fo as perfectly to cover the whole. The aperture which is left for the door is clofed occationally by a fkin or piece of matting. Thefe mats are made of a kind of $k$ ane or reed in the following masner. The reeds being laid parallel to one another, are faltened together with finews or catgut, or fume kind of catgut which they have had an opportunity of getting from the Europeans; fo that they have it in their power to make them as long as they pleafe, and as broud as the length of the reeds, which is from fix to tell feet. The colonilts make ufe of the fame kind of matting, next to the tilts of their waggons, to prevent the fail-cloch from being rubbed and worn, and likewife to help to keep out the rain.

In a craal, or Hottentot village, the huts are moft commonly difpofed in a circle, with the doors inwards; by which means a kind of court-yard is formed, where the cattle are kept at nights. 'The milk, as foon as taken from the cew, is put to other milk which is eurdled, and kept in a leather fack with the hairy fide inwards as being the more cleanly; fo that thus the milk is never drunk fweet. In fome northern diftricts, where the land is dry and parched, both Hottentots and colonilts are thepherds. When an Hottentot has a mind to fluift his duelling, he lays all the mats, klins, and rods, of which it is compofed, on the backs of his cartle, which, te a flanger, makes a monftrons, unwieldy, and even ridiculus appearance.

There is a fpecies of Hottentots named $B$, Zichmen, who dwell in the woolly and mountainous paits, and fubfilt entinely by plunder. They ufe poitoned ar-
ti nennono rows, when they hnot from beswa about a yard long and an inch in thitanels in the midde, very much pointed at both end3. Dr Sparman does not knuw the woud of which they are made, but thinks that it is ant very clatio. The fitiogs were made, fome of finews. and others of a lind of hemp, or the inner bark of fome regetable; but mof of them in a very laventy manner. The arrows are about a foot and an lalf long, headd with bone, and a triangalar lit of iron; having alfo a piece of quill bound on very ftrongly with finews, about an inch and an half from the tup, in orter to prevent it from being calily dawn out of the Reth. The whole is latily covered over with a very deally peifon of the confallence of an extract. Their quivers are two fect long and four inches in diameter; and are fuppofed by our author to be made of the branch of a tree hollowed ont, or more probably of the bark of one of the branches taken of whole, the buttom and corce being made of leather. It is daubed on the outhele with an unctuous fubllance which grows hard when dry, and is lined about the aperture with the disin of the yellow ferpent, fuppoled to be the moll deadly in all that part of the world. The poifon they make ufe of is taken from the moll venomous ferpents; and, i grorant as the Hottentots are, they all know that the puifon of ferpents may be fwallowed with fafety. See the article boshiesmen.

In the year 1770 , Lisutenant William Paterfon, who took a long and dangerons excurfion from the Cape along the wettern fide of the continerat, difcovered a new tribe of Mottentots, whofe living, he fays, is in the highett degree wretched, and who are apparently the dirtied of all the Hottentot tribes. Their drefs is compofed of the ikins of leals and jackals, the fleth of which animals they feed upon. If a grampus happen to be call ahore, tiaty remove their huts to the place, and fetd upon the catcole as long as it lafte, though perlaps it may be half rotten by the heat of the weather. They befmear their flins wit. the oil; by which means they fonell fo exceedingly raak that their approach may be thas perceived before they come in Sight. Their huts, bowever, are muc! fuperior to thofe of the fouthern Ifottentots already deferibed; being higher, thatched with grafs, and furnihed with thools made of the back-bonts of the grampus. 'They dry their lifh in the fun; as the lientenant found feve. ral kinds of tith near their huts fufpended from poles, probably for this purpoit. Ite found allo feveral aromatic phants which they hat been drying.

With refpect to the religion of the Hottentots, it dues not appear that they have any. On being quef. tioned on the futject of a Creator and Governer of the univerf, they anfwer that they know nothing of the matter; nor do they feem willing :o reseive any inflruction. All of then, however, have the moft firm belicf in the powers of magic; from whence it might be inferred that they believe in an evil being analogons to what we call the davil, but they pay no religious wot thip to him, though from this fource they derive all the evil that happens, and among thefe evils they reckon cold, rain, and thunder. So monitroufly ignorant are they, that many of the colonilts afured 1 ) Sparman, that :heir Bofhicimen would abufe the
$\mathrm{N}^{\circ}{ }_{15} 8$.
thunder witir many opprobrious spithets, and hircaten Hete to affata the thathes of lightning with old fores, or any thing that comes firit to hand. Eves the moll iatel. ligent among them could not be convinced by all the anguments our author could ufe, that rain was not always an evil, and that it would be an unhappy circumAtance if it were never to rain. "A maxim (fays he), from a race of men in other refpeess really endowed with fome fenfe, and freguently with no fmall degree of penetration and cumning, ought, methinks, to be contidered as an indetible religious or fupertlitious notion entertained by then from their infancy, rather than as an idea taken up un due deliberation and confequant conviction."
As the Hottentots have fo fleng a belief in the powers of magic, it is no wonder that they have abundance of withes and conjurors among them. Tliefe will readi'y undettake any thing, cren to put a flop to thunder and rain, provided they be well paid for their pisia; and if it happen to thunder or rain longer than the time they promised, they have always for an excufe, that a more powerful confurer has put a Aop to theis incantations. Many of the Hottentots believe that a.l diforders incident to the human body are cured by magic. The wizard; are fond of encouraging this idea; but at the fame time take care to employ buth external and internai remedies. Amons the former may be reckoned a cure performed upoa Captain Cook in fome of the South-Sea iflands, viz. that of pinching, cuffing, and kneading the whole body of the patient. To this, however, the Hottentot phylicians add that of pretending to fuck ont a bone from fome part of the patient's body. After this it Cometimes liappena that the fick perfon is relieved, and fometimes not. In the lateer cafe the operation is repeated; and, if he dies, his friends lament that he was bewitched beyond the power of any one to alfill him. Thefe conjurors appear to be pofitifed of coniderable light of hand. Our au-hor was informed by a colonill, that when he was a child, and playing with a bone of an ox which he drew as a cart, it appeared to his great altonifheneat to be fucked out of a lick perfon's back by a wizard; and as for as he could remember, the patieat recovered foon after. Thefe pretenfions of the wizards fometimes render them liable to perfecutions; and there is an intance of a chicf named Caloo, who ordered a general mafficre among them, in hopes of cutting of the perfon who he believed had bewitched himfiff, and aftheted him with fore eyes.

The fuperflution of the Hottentots never opem? in the way of making them afraist in the dark. They feem, however, to have fonse ileas of a future ftate, as they reproach their friends, whell dead, with leaving then fo foon; at the fame time admonihing the: from leenceforth to demean themfelves properly: by which they mean, that their deceafed friends thould not come back again and haunt them, nor ailow thenfelves to be made ufe of by wizads to bring any mifchief on thofe that furvive them.
There is a genus of infees (the montis) which, it has been generally thought, the Hottentots worfhip: but our author is fo far from beina of this opinion, that he tells us they have more than once catched feveral of them for him, a:a affiled lime in fticling pins
through

## H O T

tentots through them as he did through otherinfects. "There is (fays lue), however, a diminutive fpecies of this infect, which fome think it would be a crime, as well as very dangerous, to do any harm to: but this we have no more reafon to look upon as any kind of religivus worfhip, than we have to cunfider in the fame Jight a certain fupertlitious notion prevalert among many of the more fimple people in our oun country (Sweden), who imagine that three lins will be forgiven them, if they fet a cock-chafer on its feet that has happened to fall upon its back. The moon, according to Kolbe, reccives a kind of adoration from the llot. tentots; but the fact is, that they merely take tle opportunity of her beams, and at the farne time of the coohnefs of the night, to amule themfelves with dancing; aod confequently have no more thoughts of worthipping her than the Chritian colunills who are feen at that time Arolling in great numbers about the fleets, and parading on the thone tleps with which their houfes are ufually encircled." The conjururs themfelves, according to our author, are generally frecthinkers, who bave neither religion nor fuperltition of any kind.

Licutenant I'aterfon has given the following account of the Caffres, a nation whom no European but limfelf has ever feen, and who iulabit the country to the northeat of the Cape as far down as $31^{\circ}$ South Latitude.

The men are from five feet ten inches to fix feet high, and well proportioned ; and in general manifelt great courage in attacking lions or other wild beafls. The nation, at the time lie vifited them, was divided into two parties, one to the northwars, commanded by a chief named Cbatha Bca, or Tamlujlie, which latter appellation he had obtained from his muther, a woman of an Hottentot tibe named Tambukits. This man was the fon of a chief named Pharoa, who died about three years before, and left two fons Char Cha Bea, and another named $D$ firika, who claimed the fupreme authority on account of his mother being of the Caffre nation. This occafioned a contell between the two brothers, in the courfe of which Cha Cha Bea was driven out of his territories with a great number of his party; after which he took up his refidence at a place named K'bouk, where he had an opportunity of entering into an alliance with the Bothies men.-Whe Caffres are of a jut hlack colour, their eyes large, and their teeth as white as ivory. The clothing of both fexes is nearly the fame; confiltind tutirely of the hides of sxen, which are made as pliant as cloth. The men wear tails of different animals tied round their thighs, pieces of hrafs in their hair, and large rings of ivory on their arms: they are likewife adurned with the hair of lions, feathers faflened on their heads, \&c. They ufe the cercmony of circumcition, which is ufually performed upon thein when they are nine years of age. They are very fund of dogs, which they exchange for cattle, and will even give two tullocks in exchange for one dog which pleafes :hem. They are expert in throwing lances, and in time of war ufe nivids made of the hides of osen. Thronghout the day the men ocenpy themferes in hunting, fighting, or dancing; the women being employed in the cultivation of their gardens and corn. 'They feem not to be dellitute of the knowledge of agriculture, as they cultivate feveral vegctables which do not a3:uYol. VIII. Part IL.
rally grow in their own country, viz. tobacco, watcr. Hottentots. melons, a finall kind of kidney-beans, and hemp. 'The women allo make their bakets and the mats on which they lic. 'The men are very fund of their cathe, and cut their horns in fuch a marner as to be alie to turn them into any hape they pleate, and teach them to anfwer to a whifle. Mr l'derion is of opinion that the country they inhabit is greatl; fuperior to any part of Africa.

Of the Dutcha futtements and policy at the Cape, Mr Forller gives the following account.
" The incume of the guremor here is very confiderable; for, befides a fixed appointment, and the ufe of honfes, gardens, proper furniture, and every thing that belongs to his table, he receives about io dollats for every leagre of wine which the company buy of the farmer in order to be exported to Batavia. The company allows the fum of to dullars for each leagre, of which the farmer receives but $2+$ : what remains is mared between the governor and lecond or deputy; the former taking two thirds, which fometimes are faid to amount to 4000 dollars per annum. The deputy-governor has the ditection of the company's whole commerce here, and ligns all orders to the different deparments under him, as well as the governor to others. He and the fifeal have the rank of uffer hocpman. 'The fifcal is at the head of the pulice, and fees the penal laws put in execution: his income confitts of fines, and of the duties laid on cer. tain articles of commerce; but if he be llict in cxacting them, he is univarifally detefted. The found policy of the Dutch has likewife fonnd it necelfary ro place the fifeal as a cheek, to overawe the other offieers of the company, that they may not counteract the interells of their mallers, or infringe the laws of the mo-ther-country. He is, to that end, commonly well vorfed in juridical affairs, and depends folely upon the mother-cuntitry. The major (at prefent Mr Von Prehn, who received us with great politenefs) has the rank of loopmon or incrchant : this circumbance furprifes a ftranger, who, in all other Eimopean llates, is ufed to fee nilitary honours confer dillinction and precedence; and appears Aill more fingular to one who knows the contrall in this particular between Holland and Ruffia, where the idea of military rank is annexed to every place, even that of a profeflor at the univerfity. The number of regular foldiers at this colony amounts to about 700 ; of which 400 form the garrifon of the fort, near the Cape town. The inhabitants capable of bearing arms form a milisia of 4000 men : of whom a confiderable part may be affembled in a few lours, by means of lignals made from alarmplaces in different parts of the country. We may from hence make fome ellinate of the number of white people in this coluny, which is at prefent for extenfive, that the dillane fettements are ahove a month's journey from the Cape: but thele remote parts lie fonctines more than a day's junrney from each uther, are furrounded by various uations of Hottentots, and too frequently feel the want of protection from their own govermment at that dillance. I'le flaves in this colony are at leall in the proportion of fixe or more to ons white perfon. The principal ins. habitants at the Cape have fometimes from 20 to 30 saves, which are in general trated with grout lenity, $+R$ a!d

Lusteniots and fometimes become great favourites with their maflers, who give them very good cloathing, but oblige them to wear neither foes nor llockings, referving thete artickes to themfles. The flaves are chitfly brought from Madagafear, and a little veffel annually goes from the Cape thither on that trade; there are, however, befides them, a number of Malays and Bengalefe, and fome negroes. The colonifts themfelves are for the greateft part Germans, with fome families of I utch, and fome of I'rench Proteftants. 'The character of the inhabitants of the town is mixed. They are indultrious, but fond of good living, holpitable, and focial; though accuftomed to hire their apartments to flangers for the time they touch at this fettlement, and ufed to be complimented with rich prefents of Aluffs, \&x. by the officers of merchant Mips. They have no great opportunities of acquiring knowledge, there being no public fchools of note at the Cape; their young men are therefore commoniy fent to H lolland for improvement, and their female education is too much neglected. A kind of dinike to reading, and the want of public amufements, make their converfation minterefting, and too frequently turn it upon fandal, which is commonly carried to a degree of inveteracy peculiar to little towns. The lirench, Englif, Portuguefe, and Malay languages, are very commonly fpoken, and many of the ladies have acquired them. This circumblance, together with the accomplimments of linging, dancing, and playing a tune on the lute, frequently wnited in an agreeable perfon, make amends for the want of refoned manners and delicacy of fentiment. Thete are, however, among the pricicipal inhabitants, perfons of both $\int$ exes, whofe whole deportment, extenfive reading, and well-cultisated underflanding, wonld be admired and diftinguihed even in Europe. Their circumflances are in general eafy, and very often affuent, on account of the cheap rate at which the neceflaries of life are to be procured: but they feldom amals fuch prodigious riches here as at Batavia; and I was told the greatelt private fortune 2t the Cape did not exceed 100,000 dollars, or about 22,5001. llerling.
"The farners in the comntry are very plain hofpiable peorle; but thofe who dwell in the remotelt fettements foldom come to town, and are faid to be vely ignorant : 'This may eafily be conceived, becaufe they have no bettry company than Hottentots, their dwillings being often feveral days jouney afunder, wherh muft in a great meafure prechide all intecourfe. The sine is cultivated in plantations within the compats of a few days $j$ unney from the town; which were ettablifted by the fritt colonills, and of which the gromed was riven in werpetual property to them and their heirs. 'She company' at peefent never part with the property of the ground, but let the furface to the farmer for an annualrent, which, though extremely moderate, being only 25 dollars for 60 acres, yet does not give fuffecent encouragement to plant vineyards. The diflant fetlements, therefore, chiefly raife corn and rear cattle; nay, many of the fettlers entirely follow the latter branch of rullic employment, and fome have very numerousfocks. We were told there were two farm: rs who had each 15,000 theep, and oxen in propertion; and heveral who polfelfe! 6000 or 8000 theeg, of whith they drive great droves to
town every year: but lions and buffaloes, and the fa-Hottent tigue of the journey, deftroy numbers of their cattle before they can bring them fo far. They commonly take their families with them in large waggons covered with linen or leather, fpread over hoops, and drawn by 8,10 , and fometimes 12 pair of oxen. They bring butter, mutton-tallow, the flefh and fins of fea cows (hippopotamus), together with lion and rhinoceros' flins to fell. They lave feveral flaves, and commonly engage in their fervice foveral Hottentots of the poores fort, and (as we were told) of the tribe called Bosmessmen, Bofbemans, or Buflomen, who have no cattle of their own, but commonly fubfit by lunting, or by commiting depredations on their neighbours. The opulent farmers fet up a young beginner by intrulting to his care a flock of 400 or 500 fheep, which he leads to a diftant fpot, where he finds plenty of good grals and water ; the one-half of all the lambs which are yeaned fall to his fhare, by which means he foon becomes as rich as liis benefactor.
" Though the Dutch company feem evidently to difcourage all new fettlers, by granting no lands in private property; yet the products of the country have of late years fufficed not only to fupply the illes of France and Bourbon with corn, but likewife to furnif the mother-country with feveral flip-loads. Thefe exports would certainly be made at an eafier rate than at prefent, if the fettlements did not extend fo far into the country, from whence the products mult be brought to the Table-bay by land-carriage, on roads which are almoft impaflable. The intermediate fpaces of uncultivated land between the different fettlements are very extenfive, and contain many fpots fit for agriculture ; but one of the chief reafons why the colonifls are fo much divided and feattered through out the country, is to be met with in another regulation of the company, which forbids every new fettler to eftablifh himfelf within a mile of another. It is evident, that if this fettlement were in the hands of the commonwealth, it would have attained to a great population, and a degree of opulence and Cplendor of which it has not the lealt hopes at prefent : but a private company of Eaft-India merchants find their account much better in ketping all the landed property to themfelves, and tying down the colonift, lefl he fhould become too great and powetful.
"The wines made at the Cape are of the greateß variety poffible. The bett, which is made at M. Vander Spy's plantation of Conltantia, is fpoken of in Europe, more by report than from teal knowledge; 30 leagres (or pipes) at the utmof are annually raifed of this kind, and cach leagre folls for about 501 . on the fpot. The vines from which it is made were originally brought from Shiraz in Pertia. Several other forts grow in the neighbourhood of that plantation, which produce a fweet rich wine, that generally palles for genuine Conftantia in Europe. French plants of burgundy, mufcade, and frontignan, have likewife been tried, and have fucceeded extremely well, fometimes producing wines fuperior to thofe of the original foil. An excellent dry wiue, which has a fight agreeable tartnefs; is commonly drank in the principal families, and is made of Madeira vines tranfplanted to the Cape. Several low forts, not entirely difagrecable, are raifed in, great plenty, and fold at a very cheap rate; fo that
ontinger the failors of the Ealt-India thips commonly indulge themfelves very pleatifully in them whenever they come afhore.
" I'he products of the country fupply with provifrons the Ghips of all nations which touch at the Cape. Corn, flour, bifcuit, falted becf, brandy, and wire, are to be had in abundance, and at moderate prices; and their fiell grecns, fine fruits, good mutton and beef, are excellent reltoratives to ieamen who have made a long royage."

HOT"IINGER (John Henry), born at Zurich in Switzerland in 1620 , profeffed the Oriental languages at Leyden, and was etteemed by all his learned colleagues. He was drowned, with part of his family, in the river Lemit, in the year 1667 . He wrute a prodigious number of works; the principal of which are, 1. Exiercilationes Ansi Moriniand de Penteteuclo Samaritan, 4 to ; in which he defends the Hebrew text againdt father Morin. 2. Hijloria Orientalis, 4to 3. Mi. Bliohecarius quadripartimes. 4. Thefanrus Pbilologicus Sa. cra Scriphuis, to. 5. Mifforin İcclefioflica. (1. Promptuariam, fite bibliodmea Orientalis, fio. 7. Diflertationes miforllames, Sic.

HCTTONIA, water-violet: A genus of the monogynia order, belonging to the pentardria clafs of plants; and in the natural method ranking under the zitk order, Precic. The corolla is falverthaped; the flamina are placed in the tube of the corolla ; and the capfule is unitucular. There is but one fpecies, viz the paluttris, with a naked thalk. It grows naturally in the ftanding waters in many parts of England. The leaves, which ate for the molt part immerfed in water, are finely winged and flat like moft of the fea plants; and at the bottom have long fibrous roots, which frike into the mud: the fiowerftalks rife five or fix incles above the water, and toward the top have two or three whorls of purple fluwcrs, terminated by a fmall clutter of the fame. Thefe flowers have the appearance of thofe of the flock gillifower, fo make a pretty apptarance on the furface of the water. It may be propagated in deep ftandirg waters, by procoring its feeds when they are ripe, from the places of their natoral growth; which fhould be immediately dropped into the water in thofe places where they are defigned to grow, and the fpring following they will appear; and if they are not ditturbed, they will foon propagate themfelves in great plenty.-Cuws eat this plant; fwine refufe it.

Houbraken (Jacob), a celebrated engraver, whofe great excellense confifted in the portrait liuc. His works are dillinguihed by an admiathe fofnefs and deticacy of execution, joined with good drawing, and a fine tall. If his beft performances have ever been forpaifed, it is in the mallerly determination of the features, which we find in the werks of Nanteuil, Edelink, and Drevet: this gives an animation to the countenance, more eafly to he felt than defcribed. His works are pretty numerous; and moft of them being for Englith publications, they are fufficiently known in this country. In particular the greater and bett part ot the collection of portraits of Illultrious men, publifhed in London by I. and P. Knapton. were by his hand.

HOVEDON (Roger de), born of an illuflious family in Yorkfhire, moft probably at the town of that name, now called Howden, fome time in the reign of Henry I. After he had received the firlt parts of edu-
cation in lis mative country, he fudied the civ!l and canon law, which were then become mett faflionable and lucrative branchcs of learning He became do. meflic chaplain to Henry II. who emploved him to tranfact feveral ecclefiaftical affairs; in which he acquitted himfle with honour. Bot his molt meritorious work was his armals of England, from A. D. 731, when Bede's ecclefiallical hiftory ende, to A. i). 1202 . This work, which is one of the moft voluminous of our ancient hiflorics, is more saluable for the fincerity with which it is waiten, and the great varicty of faets which it contains, than for the beauty of its lyyle, or the regularity of its arrangement.

HOUGH, ham, in the manege, the joint of the hiud leg of a beaft, which conneets the thigh to the leg. Sce Ham.
To Hocgh, on cuthlic Houghs, is to ham-fring, or to difable by cutting the finews of the ham.
hoUlameres (Amtoniette de), a French hadr, whofe poetry is lighly elleemed in France. Her works and thofe of her daughter have been collected and printed together in two volumes. Moll of the Idyls, particularly thofe on theep and birds, furpafs every thing of the kind in the French language : the thoughts and expreffions are noble; and the 1 yle pure, flowing, and chalte. Mademoifelle des Horheres carrid the poetic prize in the French acadeny againf Fontenclle. Both of thefe ladies were members of the academy of Ricovatri ; the mother was alfo a member of the academy of Arles. Thofe who defire to be more particalarly acquainted with the hiftery of Madam des Houlicres, may confult her life prefixed to her works in the Paris edition of 1747, 2 vols 12 mo .

HOULSWORTHY, a large town of Devonflire, feated between two branches of the river Tamer, hasing a good market for corn and piovitions. W. Long. $44^{2}$. N. Lat. 50.50.

HOUND. See C.tNis, Blood Fouml, and Gre-Houmd
Training of llocerns. Before we fpeak of the methods proper to be ufd for this purp,fe, it will be neceffary to point out the qualitics whel fportfinen defire to meet with in thefe animals. It is generally underitood, that hounds of the middle lize are the molt proper, it heing remarked, that all animals of that defcription are flronger than either fuch as are very finall or very large. The thape of the hound ought to be particularly attended to; for if he be not well proportioned, he can neither run faft nor do much work. His legs onght to be fraight, his feet round, and not very large; his thoulders back; his brealk rather wide than narrow; his cheet deep, his back broad, his head fmall, his neck thin; his tait thick and bufhy, and if he carry it well fo much the better. None of thofe young bounds which are ont at the allows, or fuch as are weak from the knee to the foot, fhould ever be taken into the pack. 'Phat the pack may look well, it is proper that the hounds thonid be as much as poffible of a fize: and if the animals be handfone at the fame time, the pack will then be $y^{\prime}$ rfect. It malt not, however, be thought, that this contributes any thing to the goodnefs of a pack; for very unhandfome packs, confilling of hounds contucly different in fize and colour, have been known to afford very good fport. It is only neceffary that they fhould run well together; to which indeed an uniformity in

Hound. fize and fhape would feem to contribute in fome degree. The pack that can run ten mike, or any other contiderable fpace, in the thortell time, may be faid to go fahelk, though the hounds taken feparately might he conliderably inferior to others in fwifenefs. A pack of hounds, confisered in a collertis: body, go falt in proportion to the excellense of their nofes and the heal they carry. Packs which are compofed of hounds of sarious hinds feldom sun well. When the packs are wery large, the hounds are feldom fufficiently hunted to be good; wemty or thisty couple, thenefore, or at moll forty, will be abundantly futhecent for the keened forteman in this country, as thus le may be enabled to hunt three or cven four times a week. "The number of hounds to be kept, mut, however, in a contideratle degree, depend on the thenerh of the pack and the comery in which you lumt. They thould be left at home as feldom as potithe; and too many old hounds thould not be kept. None ought to be kept ahove five or fis feafons, though this alfo is fomewhat uneertain, as we have no rule for judging how hong a hound will lat.

In breeding of hounds, confideralle attention ourght to be paid to the dog from whom you breed. All fuch are to be rejected as have a tender wofe, as are lubhers or fierters. An old dog thould never be pat to an old bitch; nor fhould any attempts be made to crofs the breed unlefs in a proper and judicious manner. Mr Beekford $t$ informs us, that he has fetn foxhounds beed out of a Newfoundland dog and foxhound bitch; the whelps were montrounly ugly, and had other bad qualities befides. The crofs molt likely to be of fervice to a fox-hound is the beagle. The reafon of crofing the breeds fometimes is, that the imperfections of one may fomtimes be remedied by another. The mon hs of January, February, and March, are the bett for breeding; late puppies feldom thrive. After the females begin to grow big with young, it will not be proper in let them humt any more, or indeed to remain for a much longer time in the kennel. Sometimes thefe animals will have an extraurdinary number of whelps. Mr Beckford informs us, that he has known a bitch have 15 puppies at a litter; and he affures us, that a friend of his informed him, that a huund in his pack brought forth 16, all of them alive. In thefe cafes it is proper to put fome of the puppies to another biteh, if you want to keep them all; but if any are delloyed, the beit coloured ought to te kept. The bitches fhould not omy have plenty of Aeh, but milk alfo; and the puppits hould not be taken from them till they are able to take care of themfelves: their mothers will be relieved when they learn to lap milk, which they will do in a fhort time. After the puppies are taken away from the ir mothers, the litter fhould have three purging balls given them, one tvery other morning, and plenty of whey the intermediaze day. If a bitch bring only one or two puppies, and you lave anocher that will take them, by putting the puppies to her the former will foon be fit to huat again. She fhonld, however, be firt phyfieked, and it will alfo be of fervice to anoint her dugs with brandy and water.

Whelps are very liable to the dillemper to which dogs in general are fubject, and which frequently makes great havoc among them at their walks; and this is fugpofed by Mr Becteford to be owing to the
little care that is taken of them. "If the diftemper (fays he) once get among them, they mult all have it: yet notwidhlanding that, as they will be confantly wedl fed, and will lie warm (in a kennel buite on purpufe), I am contident it woble be the faving of many lives. If you thould adupt this nucthod, you numf remeniber to whe thene early to goo in couples: and when they become of a proper age, they muit be walket out often; for flould they remain contined, they would neither have the healh, hape, or underHanding, which they ought to have. Wben I kept harricts, 1 brad up fome of the puppies at a dillant kemul: but havine no ferwants there to exarcife thein properly, I fond them much iaferior to fuch of their brethen as had the luek to farvise the many difficulties and daneters they had undergone at their walks; thefe were afterwards equal to any thing, and afraid of nothing; whilt thofe that had been nurfed witil fo nuch care, were weakly, timil, and had every difadvantage attending prizate education. I have often hrand as an excufe for hounds not homeing a cold fent, that they were too bigh-bred. I confefs I know not what that meams: but this I know, that hounds. are frequently too ill-bred to be of any fervice. It is judgment in the breeder, and patience afterwards in. the huntfman, that makes them hunt.
"Whea young hounds are fint taken in, they fhould be kept feparate from the pack; and as it will happen. at a time of the year when there is little or no hunting, you may ealily give them up one of the kenucls and grafs court adjoining. Their play frequently ends. in a battle; it therefore is lefs danzerous where all are equally matched - If you find that they take a dillike to any particular hound, the fafett way will be to remove him, or it is probable they will kill him at lat. When a feeder hears the hounds quarrel in the kennel, he halloos to them to flop them; he then goes in among them, and nogs every hound he can come near. How much more reafonable, as well as efficacious, would it be, were le to fee whieh were the combatants before he fopaks to them. Punifbment would then fall, as it ought, on the guilty only. In all packs there are fome hounds more quarrelfome that the ret; and it is to them we owe all the mifchics that is done. If you find chaftifement cannot quiet them, it may be prudent to break their holeers; for lince they are not neceflary to them for the meat the; have to eat, they are not likely to lerve them in any good purpofe. Young hounds thould be fed twice a day, as they feldom take kiodly to the kennel neat at firlt, and the dittemper is moll apt to feize then at this time. It is better not to round them till they are thoroughly fettled; nor fhould it be put off till the hot weather, for then they would bleed too much. It may be better perlaps to round them at their quarters, when about fix months old; thould it be done fooner, it would make their ears tuck up. The tailing of them is ufually done before they are put out ; it mi hht be better, perleaps, to leave it till they are taken in. Dogs malt not be rounded at the time they have the difemper upors them, as the lofs of blood would weaken them too much.
"If any of the dogs be thin over the back, or any. more quarrelfone than the reft, it will be of wo to cut chem: I alfo fpay fuch bitches as I fhall now want to breed from; they are more ufeful, are louter, and
are always in better order; befides it is abfolutely neceflary if you hunt late in the fpring, or your pack will be very thot for want of it. The laster operation, however, decs not always fueced; ; it will be necefiary therefore to employ a flilful perfon, and one on whom you can depend; for if it be ill done, though they cannot have puppies, they will go to heat notwithfanding. They thould be kept low for feveral days before the operation is performed, and mult be fed on thin meat for forne time after."

It is impofithle to determine how many young hounds ought to be bred in order to keep up the pack, as this depends altogether on contingencies. The deticiencies of one year mull be fupplicd by the next ; tut it is probsble, that from 30 to 35 conple of old hounds. and from eight to twelve couple of young ones, will enfwer the purpofe where no more than 40 couple are on be kept. A confiderahle number, however, ought always to be bred; for it is undoubtedly, and evidently true, that thofe who breed the greatel number of hounds mult expect the beit pack.

After the homins have been rounded, become acquainted with the humefinan, and anfwer to their names, they ought to be coupled torether, and walked out among fheep. Such as are particularly ill natured ought to have their couples loofe about their necks in the kenuel till they become reconciled to them. The molt fubborn ought to be coupled to old hounds ra. ther than to young ones; and two dors fhould not be coupled together when you can avoid it. As young hounds are ankward at fuift, a few ought only to be fet out at a time with people on foot, and they will foon afterwards follow a horfe. When they have been walked out often in this manner amonglt the heep, they Thonid be uncoupled by a few at a time, and thofe chaftifed who offer to run after the theep; but it will be difficult to reclaim them after they have once been allowed to tale blood. Some are aceutlomed to couple the dogs with a ram in order to break them from theep; but this is very dangerous for both parties. Mr Beckford relatcs a flory of a nobleman who put a large ram into his kennel in order to break his hounds from theep: but when he came fome time after to fee how nobly the ram defended himflf, he found himentirely eaten up, and the hounds gone to deep after having filled their bellies.

When hounds are to be aired, it is belt to take them out feparately, the old ones one day, and the young another; though, if they are to lave whey from a diflant dary, both old and young may be taken out together, obferving only to take the young hounds in couples, when the old ones are along with them. Young hounds are always apt to fall into mifchicf, and even old ones when idle will be apt to join them. Mr Beckford mentions a whole pack running after a flock of fheep through the mere accident of a horfe's falling, and then running away.

With regard to the firt entering of hounds to a feent, our author gives fuch directions as have fubjected him to a fevere charge of inhumanity. We thall give them in his own words. "You had better enter them at their own game; it will fave you much trouble afterwards. Many dogs, I believe, like that feent beft which they were firft blooded to: but be this as it may, it is mont certainly reafonable to ufe them zo that which it is intouded they mould thant. It may
not be amifs firft when they begin to hunt to put light Hound. collars on them. Young hounds may eafly get out of their knowledse; and thy ones, after they have beert much beaten, may not choole to return home. Collars, in that cafe, may prevent their being ioft.-You fay you like to fee your young hounds run a trail-fcent.-1 have no doubt that you woull be glad to fee them run over an open down, where you could fo cafily obferve their action and their fpeed. I cannot think the doing of it once or twice could hart your hounds: and yet as a Cpoufman I dare not recommend it to you. All that I can fay is, that it would be lefs bad than enicring them at hare. A cat is as good a trailas any ; but on no account fhould any trail be ufed after your hounds are Rooped to a feent. I know an old foortfman who enters his young hounds firft at a cat, whicis he drags along the gromed for a mile or two, at the end of which he turns out a badger, frot taking care to break his teeth : he takes out about a couple of ohd hounds along with the young ones to hidd them on. He never enters his roung bounds but at vermin; for he fays, 'Train up a child in the way he thould go, and when he is old he will not depart from it!"

Hounds ought to be entered as foon as polible, though the time mult be unectiain, as it depends on the nature of the country in which they are. In corn countries hauting may an be practicable till the corn is cut down; but you may begin fooner in grafs countries, and at any time in woodlands. "If (fays Mr Beckford) you have plenty of foxes, and can afford to make a fucrifice of fome of them for the fake of inaking your young hound's fleady, take them firtl where yoti have lealt riot, putting fome of the theadictt of your old hounds anong them. If in fuch a place you are fortunate enough to find a litter of foxes, you may aflure yourfelf yous will have but little trouble with your young hounds afterwards.-II, owing to a fearcity of foxes, you flould foop your hounds at hare, let them by no means have the blood of her; nor, for the fake of connitency, give them much encouragement. Harc-hanting has one advantage; - hounds are chiefly in open ground, where you can eafily command them; but notwithtanding that, if foxes be in tolcrable plenty, keep them to their own game. -Frequent hallooing is of ufe with young houndo: it keeps them forward, prevents their being loit, and linders them from hunting after the rett. The oftener therefore that a fos is feen and hathood, the better. 1 by no means, however, approve of much hallowing to old hounds; thougli it is true that there is a time when hallooing is of ufe, a time when it does hurt, and a time when it is perfectly indifferent: but long practice and great attention to hunting can only teach the application.
"Hownds at their Grat entrance cannot be encou. raged too much. When they are become handy, love a feent, and begin to know what is right, is will then. be foon enough to chattife them for what is wrong ; in which cale one fevere beating will fave a great deal of trouble. When a hound is flogged, the whipper in thould make ufe of his voice as wellas his whip. If any be very unlteady, it will not be amifs to fond them out by theinfles when the men go out to cecreife their horfes. If you have hares in plenty, let fone be foand fitumes. and turned out before them; and you will find that: the :hoft dotous will not rua after then. If you in.-

F"wnd. tend them to be fleady from deer, they hould often Fee deer, and then they will not regard them; and if efter a probation of this hind you turn out a cub before them, with fome old hounds to lead them on, you may aflure yourfelf they will not be uriteady long."
It is proper to put the young hounds into the pack when they floop to a feent, become handy, know a rate, and flop cafly. A few only are to be put to the pack at a time : and it is not advifable even to begin this till the pack have been out a few times hy themfelves, and "are gotten well in blood." They fhould be low in fleh when you begin to hunt; the ground being generally hard at that time, fo that they are liahle to the thaken.-By hounds being beudy, our author means their being ready to do whatever is required of then ; and particularly, when calt, to tura ealily which way the huntiman pleafes.

Mr Beekford begins to hant with his young hounds in Augut. The huntfman in the preceding months keeps his old hounds liealthy by giving them proper exercife, and gets his young houncs forward: and for this purpofe nothing anfwers fo well as taking them frequenty out. The huntfman fhould go along with thim, git frequently of his horfe, and eacourage them to come to him:-too much refraint will frequently incline the hounds to be riotous. Our author frequentty walks out his hounds among ineep, hares, and deer. Sometimes he turns down a ca: before them, which they kill; and when the time of hunting approaches, ine turns out young foxes or badgers; taking out fome of the morl theady of his old hounds to lead on the young ones. Small covers and furze brakes are drawn xith them to ufe them to a halloo, and to teach then obedicnce. If they find improper game and hunt it, they are Ropped and brought back; and as long as they will flop at a rate, they are not chaftifed. At fich times as they are takea out to air, the bunt fman leads them into the country in which they are defigned to hunt; by which means they acquire a knowledge of the country, and cannot mifs their way home at any time afterwards. When they begin to lunt, they are firft brought into a large cover of his own, which has many ridings cut in it; and where young foxes are turned out every year on purpofe for them. After they have been hunted for fome days in this manner, they ate fent to more diflant covers, and more old hounds added to them. There they continue to hunt till they are taken into the pack, which is feldom later than the beginning of September; for by that time they will have learned what is required of them, and fildom give much tronble afterwards. In September he begins to hunt in earnet ; and after the old houds have killed a few foxes, the young ones are put into the pack, two or three couple at a time, till all have hunted. They are then divided; and as he fellon has occation to take in more than nine or ten couple, one half are taken out one day, and the other the aext, till they arc iteady.

Torender fox-lunting complete, no young hounds thould be taken into the pack the firlt feafun ; - a sequifite too expentive for mont fportimen The pack thould confit of abumt to couple of hounds, that have hunted one, two, three, four, or five feaions. The young pack hould conlitt of about 20 couple of young hounds, and an equal number of old ones. They houd thave a feparate eltablifhent, and the two kenne's
fhould not be too ncar one another. When the feafon Hounce is over, the beft of the foung hounds fhould be taken iuto the pack, and the draught of old ones cxchanged for them. Many mult be bied to emable a fportfman to take in 20 couple of young hourds every feafon. It with always be eafy to keep up the number of old hounds: for when your own draft is not fufficient, drafts from other packs may be obtained, and at a small expence. When young hounds are hunted to. gether for the firft feafon, and have not a fufficient number of old ones along with them, it does more harm than good.

Kínel for Hounds. See Kennel.
HOUNSLOW, a town of Middlefex, 10 miles from London. It is fituated on a lieath of the fame name: and belongs to two parihes, the north fide of the ftreet to Hefton, and the fouth fide to lleworth. It is lituated on the edge of a heath of the fame name, and near it are powder-mills. It has fairs on Trinity-Monday, and Monday after September 29. IHere is a charityfchool and a chapel. In this place was formerly a convent of inendicant fiars, who, by their inftitution, were to beg alins for the ranfom of captives taken by the infidels. -The heath is noted for robberies and horfe-races.

HOU evanc, a province of China, occupying nearly the centre of the empire: the river Yang-tiekiang traverfes it from welt to $\epsilon^{2} ?$; and divides it into two parts, the northern and fouthern. This province (the greater part of which is level, and watered by lakes, canals, and rivers) is celcbrated for its fertility ; the Clinefe call it the flore-houfe of the empire; and it is a common faying among them, that "the abundance of Kiang-fi could furnifi all China with a breakfalt ; but the province of Hou-quang alone could fupply enough to maintain all its inhabitants." Some princes of the race of Hong.vou formerly refided in this province; but that farmily was enitrely deftroyed by the Tartars when they conquered China. The people here boaft much of their cotton cloths. fimples, gold-mines, was, and paper made of the bamboo-reed. The northern part of the province contains eight fou, or cities of the firlt clafs, and fixty of the fecond and third. The fouthern comprehends feven of the firf clafs, and fifty-four of the fecond and third, exclutive of forts, towns, and villages, which are every where to be found.

HOUR, in chronology, an aliquot part of a natural day, ufually a $24^{\text {th }}$, but fometimes a 12 th. The origin of the word hora, or afe, comes, according to fome authors, from a furname of the fun, the father of hours, whom the Egyptians call Horus. Others derive it from the Greck opstar, to terminate, difinnguifb, \&cc. Others from the word upov urine; holdinc. that Trifmegilus was the firft that fettled the divirion of homrs, which he did from obfervation of an animal confecrated to Serapis, named cynoccplatus, which makes water 12 times a-day, and as often in the nigh, at equal intervals.

An hour, with us, is a meafure or quantity of time, equal to a $24^{\text {th }}$ part of the natural day, or nycthemeron; or the duration of the $24^{\text {th }}$ part of the earth's diurnal rotation. Fifteen degrees of the equator anfwer to an hour; though not precifely, but near en ugh for common ufe. It is divided into $60 \mathrm{mi}-$ nutes; the minute into 60 feconds, \&c.

Hours ${ }^{\text {- }}$ The divifion of the day into hours is very ancient : as is hown by Kircher, Ocdiph. A.sypt. T'om. II. P. II. clafi. V1I. c. 8. : though the pafiages he quotes from Seripture do not prove it.- Phe molt ancient hour is that of the 12 th part of the day. Herodotus, lib. ii. obferves, that the Greeks learnt from the Egyptians, among other things, the method of dividing the day into twelve parts. - The aftronomers of Cathaya, \&c. bifhop Beveridge obferves, till retain this divifion. 'They call the hour chas, and to each chag give a peculiar name, taken from fome animal: 'The firit is called zefl, "moufe;" the fecond, cliu, "bullock ;" the third, zem, " leopard;" the fourth, nau, "hare;" the fifth, chin, "crocodile, sec.

The divifion of the day into 24 hours, was not known to the Romans before the firt Punic war. l'ill that time they only regulated their days by the rifing and fetting of the fun. They divided the 12 hours of their day into four, viz. prime, which commenced at fix oclock; sbich, at nine; fixh , at twelve, and none, at threc. They alfo divided the night into our watches, each containing three hours.

HOURS, HORf, in th:: ancient mythology, were certain goddefles, the daughters of Jupiter and Themis; at firft only three in number, Eunomia, Dice, and Irene ; to which were afterwards added two more, Carpo and Thallote.

Homer makes them the doorkeepers of heaven. Ovid allots them the employment of harnefling the fun:

Fungere equos Titan oetsibus inperat Horis.
And fpeaks of them as Atanding, at equal diftances, about the throne of Sol:

$$
\text { —ct, } 1 \text { ofit.c /patios cqualious, } \mathrm{H} \cdot \mathrm{rre}
$$

The pocts reprefent them as drefled in fine coloured or embroidercd robes, and gliding on with a quick and eafy motion.

Hours, Hors, in the Romifh church, are certain prayers performed at flated times of the day; as mattins, vefpers, lauds, \&x.-The leffer hours are, prime, fierce, fixth, and none. They are called hours, or canonical bours, as being to be rehearled at certain hours preferibed by the canons of that church, in commemoration of the mylteries accomplified at thole hours. Thefe hours were anciently alfo called courfe, curfus ; F. Mabillon has a diftertation on them, intilled, $D_{e}$ Curfu Gallicano.

The firft conititution enjoining the obfervation of the canonical hours, is of the ninth century, being found in a capitular of lieito bimop of Daflal direced to his curates, importing that the priells thall never be abfent at the canonical hours either by day or night.

Hour-Glafs, a popular kind of chronometer or clepfydra, ferving to mealure the flux of time by the defcent or rumming of fand out of one glafs veffel into another. The bett hour-glaffis are thufe which, inttead of fand, have egg-fhells well dried in the oven, then beaten fine and fifted. - Hour-glaffes are much ufed at fea for reckoning, sec.

HOURIS, in modern hiftory, is a name given by the Mahometans to thofe females that are defigned for the faithful in paradife. Thefe are not the farne with , whom they have lived on earth, but formed for this purpofe with fingular beauty and undecaying clarms.

HOUSE, a habitation, or place built with conveniencies for dwelling in. Sce. Architecture.

Houses, amongit the Jews, Greeks, and Romang,
were flat on the top for them to walk upon, and had ufually llairs on the outfide, by which they might afeend ard defeend without coming into the houfe. Each houre, in fact, was fo laid out, that it inclofed a quadrangular area or court. This court was cxpofed to the weather, and being open to the תky, gave light to the houfe. This was the place where company was received, and for that purpofe it was frewed with matts or carpets for their better accommodation. It was paved with marble or other materials, according to the owner'a ability, and provided with an umbrella of vellum to fhelter them from the heat and inelemencies of the weather. This part of their houfes, called by the Romans impluvium, or cava adium, was provided with channels to carry of the water into the common fewers. The top of the houfe was level, and covered with a ftrong platter by way of terrace. Hither, efpecially among it the Jews, it was cullomary to retire for meditation, private converfe, devotion, or the enjoyment of the evering breezes.
'The Grecian honfes were ufually divided into two parts, in which the men and women had diftinet manfions afligned. The part afligned to the men was towards the gate, and called Arsowith; ; the apartment of the women was the fartheit part of the houfe, and called luyarewitas. Jews, Greeks, and Romans, fuppofed their houfes to be polluted by dead bodies, and to land in need of purification.

House is allo ufed for one of the eftates of the kingdom of Britain affembled in parliament. Thus we fay the houfe of lurds, the houfe of commons, \&c. See Peers, Commonis, Sec.

House is alfo uled for a noble family, or a race of illuftrious perfons iffued from the fame flock. In this fenfe we fay, the houfe or family of the Stuarts, the Buurbons, the honfe of Hanover, of Aufria, of Lorrain, of Savoy, \&c.

Cheap, eafy, and expeditious MTetbod of confruiting Houses, wolvich have been found to be very ufeful bo/pituls for the recovery of the fick, and sherefore may probabiy mat: very wholefome places of refulenie for the bealloy. - The frit thing to be done is to choofe a dry and airy fituation, on a gravelly or chalky foil if poflible; upon chis lay down the plan of your building, make one end of it face that quarter from whence the purell and healthieft winds may be expected to blow, of a breadth that can be conveniently roofed. Then, if boarding does not come fo cheap, drive ftakes, at about fix feet diftance from each other, into the ground, fo as to fland about lix fect above it; and, interlacing them with wattles, coat the wattles on the fide next the weather with frelh ltraw; and make the roof in the fame manner, but thicker, or of thateh in the ufual way, with a hole at the very top of it, to open occafionally. Let the end of the building facing the wholefomett quarter lie open fome feet back, fo as to form a porch, where the convalefeents may take the air without danger of any injury from the wcather. A large chimney and kitchen grate may be erected at the other end. If the foil bappens to be chalky or gravelly, you may hollow it four or five feet deep, within a foot or eighteen inches of the walls; but let the fleps into this hollow lie far cnough within the porch, that no water may get into it, and, if of chalk, the fleps may not grow nippery in wet weather. From time to time open the vent-Jole at the roof; by means.

Houfe. of which all the unwholefome infectious air, as being warmer, and confequently lighter, than that which is pore and wholelome, will be driven out by the ruthing in of the freth air: a purpole, which the little openings, that may be left in the fides and roofs of fuch rude and hatty buildings will, even of themfelves, anfwer fo well, as fufficiencly to compenfate any cold they may let in, even in the coldett monehs. Let the floor likewife be feraped three or four inches deep every five or fix days, and what comes off remaned to fome diltance. Halls of this kind, 50 feet long and 20 broad, colt but a trifte to build; yet, wirh thefe frecautions (even without the addition of - lean haw for every new patient to lie on, inclofed in clean wathed facks fit for the pupole, which come infinitely cheaper than the bare cleaning of flock or even feather beds, fuppoing it polfible to wafh fuch beds), proved of infinitely more advantase in the recowety of lick foldiers, than the low-roofed rooms of the farm houles of the Itle of Wight, or even the better accommodations of Carifurouke caltle in the fame illand, in which there perithed foar times the number of fick that there did in the fe temporary reecptacks; which were firt thought of by doctor Procklefy, on occafion of fome terrible infections from confined animal effluvia.

Is it not [urprifing, that we have not availed ourflles more of the above difeovery in natural hiftory, heing, perbaps, the molt important the moderns can boaft of, in the molt uffful feience, viz. the fuperior lightnets of unwholefome and infectious air! The upper fathes in mot houfes, even of thofe who pretend to fome knowledge in thefe matters, are generally immovealle, by means of which no part of the foul air above the level of the lowelt rail of the other faft's greatclt ride can efcape by the window; and, if it efeapes by the doors, it is generally for want of a vent in the higheft part of the roof, merely to accumulate in the upper tory of the boule, and add to the infection, which the great quantities of old furniture ufually fored up there are of themfelves but too apt to ercate, when care is not frequently taken to open the windows of it. Thus, the chief benetit to be expeeted from lofty rooms is in a great meafure lof. Whercas, were the upper fathes contrived to come Sown, all the air might be ealily changed, and that almoft infentibly, by letting them down an inch or two. Nay, the upper fafh might be often let entireIy down with lefo danger or inconvenience from cold, than the lower thrown up the tenth pait of an inch, though the doing of the former would be attended with infinitely mote advantage to the health of the inhabitants than the latter. It is, perhaps, on this principle, that we are to acconut for the good health injoyed by the poor who live crowded in damp cellars, and viten with great numbers of rabbits, poultry, and even fwine about them. Thefe cellars are open to the Hrect, with doors reaching fiom the floor to the very ceiling, but never fo clole at bottom or at top as to prevent a free circulation of air ; in confequence of which, that all-vivifying fluid, as falt as it is fpoiled by patfing through the lungs of the inhabitants and their Atock, or is infected by their infentible perfpiration, excrements, \&c. is driven out and replaced by the frefh air.

House, in altrology, denotes the twelfth part of the heavens.

The divifion of the heavens into honfes, is founded upon the pretended influence of the thars, when meeting in them, on all fublunary bodies. I'hefe influences are luppoled to be good or bad; and to eaclı of thele houfes particular virtues are affigued, on which attrologers prepare and form a judgment of their horofoupes. The horizon and meridian are two circles of the crleAtial houfes, which divide the heavens into four equal parts, each containing three honfes; lis of which are above the horizon and lix bslow it; and fix of thele are called coflom and dix eweflorn boases.

A fcheme or figure of the heavens is compoled of 12 triangles, all called boifes, in which is marked the thars, Gugs, and planets, to included in each of thefe circles. Every planet has likewife two particular houfes, in which it is potended that they exert their influence in the Atronget manner ; but the fun and moon have only one, the houfe of the former being Leo, and that of the latter Cancer.

The houfes in altrolory have alfo names given them according to their qualities. The firt is the houfe of life: this is the afcendant, which extends five degrees above the horizon, and the reft below it. The fecond is the honfe of riches: the third, the houle of brothers: the fourth, in the lowelt part of the heavens, is the houle of relations, and the angle of the earth : the fifth, the boule of children: the fixth, the houle of health: the feventh, the boufe of marriage, and the angle of the welt : the eighth, the houle of death: the ninth, the houfe of piety : the tenth, the houfe of offices: the cleventh, the houfe of friends: and the twelfth, the houle of enemies.

Country-Hovse, is the villa $\dagger$ of the ancient Ro- $\dagger$ Seel mans, the quinta of the Spaniards and Portuguefe, the cloforic and caffine of the French, and the vigna of the Italians.

It ought always to have wood and water near it; thefe being the principal beauties of a rural feat. I'he trees make a far better defence than hills, as they yield a cooling and healthy air, made during the heat of fummer, and very much bieak the feverities of the winter feafon.

It fhould not he fituated too low, on account of the moifture of the air; and, on the other hand, thofe buile on places expofed to the winds are expenlive to keep in repair. In houfes not above two Mories high, and upon a good foundation, the length of two bricks, or Is inches, for the heading courle, will be fufficient for the ground-work of any common Aructure; and lix or feven courfes above the earth, to a water-table, where the thicknefs of the walls are abated or taken in, on either lice the thicknefs of a briek, riz. two inches and a quarter. But for large and high houles of three, four, or five Atories, with garrets, their walls ought to be three heading courfes of bricks, or 28 inches at leaft, from the foundation to the firlt water-table; and at every llory a water-table, or taking in, on the infide, for the fummers, girders, and joilts to red upon, laid into the middle, or one quarter of the wall at leall, for the better bond. But as for the partition-wall, a brick and half will be fufficiently thick: and for the upper ftories, a brick leng th or nine inch brick will fuffice.
her-Mueise. See Srove and Hipocaustiom.
No 158.

Fousf.Breaking, or Robbing, is the breaking into and robbing a houfe in the day-time; the fame crime being termed burglary when done by night: both are felony without benefit of clergy.

HOUSEHOLD, the whole of a family confidered collectively, including the miftrefs, children, and ferwants. But the houfchold of a fovereign prince includes only the officers and domeliics belonging to his palace.

The principal officers of his majefty's houfelold are, the lord lleward, lord chamberlain of the houfthold, the groom of the Atole, the mafter of the great wardrobe, and the mafer of the horfe.

The civil government of the king's houfe is under the care of the lord thesard of the king's boufehold; who, being the chief officer, all his commands are obferved and obered. His authority extends over all the other officers and fervants, except thofe of his majeft's chapel, chamber, and itable, and he is the judge of all crimes committed cither within the court or the verge.

Under him are the treafurer of the houfchold, the comptroller, coffers, the inater of the houfchold, the clerks of the green-cluth, and the officers and fervants belonging to the accounting houfe, the marfhalfea, the verge, the king's kitchen, the houfthold kitchen, the acatery, bake-houfe, pantry, buttery, cellar, paltry, Ecc. Next to the lord fteward is the lord chamberlain of the houfehold, who has under him the vice-chamberlain, the treafurer, and comptroller of the chamber; 48 gentiomen of the privy chamber, 12 of whom wait quartetly, and two of them lic every night in the privychamber; the gentleman ufher, the groums of the great chamber, the pages of the prefence chamber; the macebearers, cup bearers, carvers, mulicians, \&c. See Lord

I lie groom of the llole has under him the 11 other lores wf the bed chamber, who wait weekly in the bed. chamber, and by turns lic there a-nights on a palletbed; and alfo the grooms of the bed-chamber, the pages of the bed-chaaber and back-tairs, \&c. See Groum of the Stole.

The maller or keeper of the great wardrobe has under him a deputy, comptroller, cletk of the robes, binfuer, ise. and a number of tradermen and arsificers, who are all fio orn fervants to the king.

The mafter of the horie has under his command the equerries, pages, footmen, groome, coachmen, farriers, fadders, and all the other officers and tradefmen employed in his rajefty "s Rables.

Next to the civil lift of the king's court, is the military, confiting of the band of gentemen penfion. ers, the yeomen of the guard, and the troups of the houfeluld; of which the two firft guard the king above flairs.

When the king dines in public, he is waited upon at table by his majelty's cup-bearcrs, carvers, and gentemen fewers; the muficians playing all the time. The dinner is brought up by the yeomen of the guard, and the gentlemen fewers fet the difles in order. The carvers cut for the king, and the cup. bearess ferve him the drink with one knee on the ground, after he has firt tafted it in the cover.

House and Window Duty, a branch of the king's extraordinary revenue *-As carly as the conquit mention is made in domefday book of fumage or fu-

Vob. VIII. I'art II.
gage, vulgarly called fmole-farthings; which were paid by cufom to the king for every chinncy in the houfe. And we read that Edward the Black Prince (foon af. ter his fucceffes in France), in imitation of the Englifh cuitom, impofed a tax of a florin upon every hearth in his French dominions. But the firlt parliamertary eftablifhment of it in England was by llatute 13 \& It Car. II. c. ro. whereby an hereditary resenue of 2 s . for every hearth, in all houfes paying to church and poor, was granted to the king for ever. And, by fub. fequent itatutes, for the more regular affefment of this tax, the conltable and two other fubtantial inlabitants of the parilh, to be appointed yearly (or the furveyor appuinted by the crown, together with fuch confable or other public officer), were, once in every year, empowered to view the iufide of every haufe in the pawith. But, upon the Revolution, by ilat. 1. W. \& M. c. ro. hearth moncy was declared to be " not only a great oppreffion to the ponrcr fort, but a badge of flavery upon the whole people, expoling every man's houfe to be critered into and fearched at pleafure, by perfons unknown to him; and therefore, to ereet a lafting monument of their majertics goodnefs, in every houfe in the kingdum the duty of hearth-moncy was taken away and abulihed." This monument of goodnefs remains among us to this day: but the prufpect of it was fomewhat darkened, when in fix years afterwards, by tatute ; W. III. c. 18. a tax was laid upon all houfes (except cattages) of 25 . now advanced to 3 s. per houfe, and a tax alfo upon all windows, if they exceeded nine, in fuch haufe. Which rates have been from time to time varied, being now extended to all windows exceeding fix; and pawer is given to furverors, appointed by the crown, to infpeet the outhide of houfes, and allo to pafs through any houfe, two days in the year, into any court or yard, to infpeet the windows there.
Schemes of the different rates of duty upan hnufes and windaws may be feen in the Almunatis, or in Kear foy's Tax-Tables publifhed yearly.

House-Leck, in botany. Sce Stde y and Semper. nivem.
HOUSING, or Horse-Line, in the fea-langlage, a fmall line, formed of three fine frands or twits of hemp, fmaller than rope.yarn. It is chicfly ufed to feize blocks into their hrops, to bind the carters of the fails, or to fatien the bottom of a fail to its bolirope, \&ec. Sce Bort-Rope.

Housing, or Honfer, a cover laid over the faldle of a horfe, in order to fave it from the weather, Cirt, \&.c. The word is formed of the French / saje, which fignifies the fame thing ; though it anciently denoted a kind of hood worn by cauntry people. -The cavalices appeared with their embroidered houfings.
Housing, amone bricklayers, a term ufed for a brick which is warped, or is calt crooked or hollow ia burning; in fuch a cafe, they fay it is houfing.

HOUSTON:A, in botany; a genus of the monc. gguia arder, belonging to the tetrandria clafs of plants: and in the natural method moking under the 4 th order, Stellitis. The corolla is monopetahus and fumelthaped ; the capinle bilocular, difpermous, fuperior.
HOU.TCHEOU-FOU, a city of China, in the province of Tche-kiang. It is a city of the firll clafs; and is fituated on a lake, from which it takes its name. The quantity nf filk manufactured here is almaft incre-
dible.

## H O W

Homas.! dibic. 'Io rive fome idea of it, we fall only fay, that the tribute paid by a city under its jurifdiction, named Ti-bfirbbien, amounts to more than $500,000 \mathrm{fa} \mathrm{B}_{\mathrm{l}}$ or ounces of fiver. Its didriet contains leven cities, one of which is of the fecond, and fix of the third, clafs.

HOWARD (HENRy), earl of Surry, a loldier and a poet, the fon and gandion of two lort treafurets, dukes of Norfolk, was born probably about the year 1520 , and educated in W'ind or calle, with young F'itzrovearl of Richmond, natu:al fon to king lien. VIIl. Wood fays, from tradition, that he was fore time a ftudent at Cardinal Colloge, Oxtord. In his youth he becane enamonerd of the liais Geraldine, whom his fonnets have immortalized. In 1532, Howard with his companion Richnond was at Paris, where thcy continued fome time. The later died in 1536 ; after velich our young hero made a towr to Italy, and at Flatence, like a true enomarato, pablimed a challenge againt all comers, whe ther Chithane, Jews, Saracens, Turke, or cammibals, in defence of the beanty of his fair $G=r a!d i n e$; and was victorious in the tournament antlinated by the grand duke on the occafion. The duke, we are told, was fo charmed with his gallant exploits, that he would gladly have retained him at his cont: but he rejected the inctation, being determined to maint in the faperlative beaty of his Getaldine in all the principal cities in Italy. This romantic refolntion was however follrated by the command of his foe ereign, Henry VIII to return to Enylard.

In $: ; \%$, he lignaliced himfelf in a totrnament at Weftminller, againt Sir John Dudley, Sir Thomas Seymour, and others. In 1542, he marched, mader the command of his father, agraint the Scots; and in the fame year was contined in Windfor catlle for cating fefh in Lent, contrary to the king's proclamation. In 15it, en the expdition to Boalogne in France, he was appunticid field narfhal of the Englith army; and afor the taking of that town, in $15+6$, made captaingenetal of the kine's forcesin France. He was at this time knight of the garter. In the fame vear, attempting to incuced a conroy, he was defeated by the French, and ioon ater fupuleded in his command by the earl of Hertford.

Sury, after his reworn to Endunt, confoious of his former fervices, and peevift under his diferace, could not help reftetting on the king and conncil. 'lbis was his firft ftep towards dedrnction. He had marrical Frances, the dangher of John earl of Oxford; and, after her death, is faid to hase made love to the prin$c \in f$ Mary. For this the Seymonrs, rivals of the N rfolk family, and now in favon with the king, accafed him of afpiring to the crown; addinge, that he alroady prefumed to quarter part of the rogal arms with his oun: but, whatever might be the pretence, the caufe of his min was the jealonfy and power of his enemies. Iu thont, the defluction of the Howads being determined, Surry, and his father the duke of Norfolk, were commited to the Tower, in Decomber 1546 ; and on the 13 th of January following, Sury was tried at Guild hall by a common fury, ant beheaded on 'Tover-hill on the agth day of the fame monath, nine days before the death of the king ; who thas, that the meafure of his crimes wieht be full, fimithed hes life with the murder of his hett fuld it. The accufations bought againlt chis amiable andinoocent young noble-
man on his trial, were fo extremely ridiculore, that one is altonifhed low it was polfible, even in the moft defpotic reign, to find a judge and jury fo pulillmimoufly villanous as to carry on the farce of juttice en the occafion. We boalt of our excchent conflitution, and our trial by jurics; but this example may teach us, that our conthitution and our juries are not incompatible with defyotic monarchy. Ihe was tirt interred in the cliurch of All-hallows, Bukin, nea Towerhill ; and afterwards, in the reign of king James I. removed to Farmingham in Suffulk, by his fon Heury call of Northampton.

As to the chanacter of this unfortunate earl, all our poets have fung his praife. Mr Walpole begins hia anecdotes of Surry with then worls: "TVe now emetge from the twilight of learning to an almoll claffic author, that ornament of a buile erous, yet not unpolifiod cout, the earl of Surry, celebrated by Drayton. Diyden, Fenton, P pe, illulloted by his own mufe, and lamented for his unliappy death: a man (as Sir Walter Raleigh fays) no lel's valiant than learned, and of excellent hopes." Leland calls loim the confcript enrolled heir of Sir 'Thomas Wyatt, the eder, in his learning and other excellent qualities; and the author of The Art of Envils Poety fays, that the carl of Sury, and Sur Thomas Wyait, riay be jufly called the refurners of ow poetry aw foyle. His poems werc publifted in $1557,12 \mathrm{mo}$; and in 1565,157 , $15,5,153,8$ ro. Several of the fonnets are by Sir Thomas Wyatt and ethers.

Howard (Charles), an able Ratefman and experienced famen. was the fon of lond William Howard, baron of Eflingham, and born in 1536. He ferved under his fother, who was lord high admiral of England, till the accefi on of gueen Dixabeth. In Jansary 15\%.3. he freceeded his fither in lis title and ellate: atter which be fuccefterly became chamberlain of the honfentand anight of the enster; and in 158 ; was made lond high adanal, at that critical juncture when. the Spaniaro werefuding their Armada, in theiropinion, $t$ o the affured congaeil of this kingdom. When herectived iatrligence of the approach of the Spanith dect, and faw the prodigions confeguence it was to get out the few nhips that were ready at llymonth, he not oaly gave orders in cwery thing himelf, bui wrought afo with his own hands, and the firt highi lefi the port with lix dhips. The nent morning, though he had only 30 fail, and thore the fmallel of the leet, he attacted the Spanifh navy; but frot difpatched his brother-in-litw Sir Edward Hoboy, to the queen to Aefire her to make the proper difpoftion of lier landforces for the fectrity of the coalt, and to haften as many thips as poffible to his alfilance. His valour was conficuoufly difplayed in his repected attacks of a fuperine cnemy. The conlnels of his temper was no lefe confpicnous; and it was owing to his magnenimity and pridence that the victory was fo great The queen expreffed hor tenfe of his merit in the mot honzurable terms; and granted himea pention for life. In 1596, he commanded in chief at fea, as F.ficx did by land, the forces fent againft Spain when his prodence and moderation were among the principal caufes of the luccefs the Englim met with in that great and glorions enterpize; fo that, upon his return the next year, he was advanced to the dignity of extr of Nutingham.
loward. The next eminent fervice in which his IordMip was engaged was in 1599, when the Spaniards feemed to meditate a new jnvation. Her majelty, who always placed her fafety in being too quick for her enemies, drew together, in a fortnight's time, fuch a flect, and fuch an army, as took away all appearance of fuecefs from her foreign and domettic enemies; and the gave the earl the fole and fupreme command of both the fleet and army, with the title of lord lieutinant soneral of all England, an offiec unknown in fucceeding times. When age and infirmity had unlitted him for action. he refigned his offee, and fpent the remaining part of his life in eafe and retirement, till the time of his deceafe, which happened in 3624 , in the 87 th year of his age.

Howard (John), Efi; a man of fingular and tranfcendent humanity, was the fon of a reputable tradefman in St Paul's church-yard. He was born about the year 1725 or 1726; and at a proper age was put apprentice to Mr Nathaniel Newnltam, a wholefale groeer in Watling freet. His father died, leaving only this fon and a daugliter, to both of whom he bequeathed handfome fortunes; and by his will directed that his fon hould not he confidered of age till he was five and twenty. His conllitution was thought very weak, and his leealth a)peared to have been injured by the neeeftary duties of his apprenticenip; and therefore, at the expiration of it, the took an apartment in a lodging-houle in Church-Atreet, Stoke Newington, Middlelex ; but not mecting with the tenderelt treatment there, he removed to another lodsing houfe in the fame ftreet, which was kept by a widow lady Mrs Sarah Lardean, a worthy fendible woman, but an invalid. IHere he was nurfed with fo much care and attention, that be refolved to marry lis landlady out of gratitude for her kindnefs. In vain the expoltulated with him upon the extravagance of fuch a procecding, he being about 28 and the about 51 years of age, and 20 years older in conftitution : but nothing could alter his refolution, and they were pilvately married about the year 1752 . She was poffeffed of a fmall fortune, which he prefented to her filler. During his refidence at Newington, the minilter of the diffenting meeting-houfe there refigned his office, and a fucceffor was elected; and Mr Howard, who was bred a difienter, and thedfatty ndhered all his life to that profeflion, propofed to purchafe the leafe of a lionfe near the meeting-houfe, and to appropriate it as a parfonagehoufe for the ufe of the miniller for the time heing, and contributed $50 \%$ for that purpofe. His wife dicid November 10.1755, aged 54; and he was a fincere and affectionate mourner for hicr death. About this time, it is belicued, he was eleoted F. R. S. In the year 1756 he had the fortune to experience fome of the evils which it afterwards became the bufinefs of his life to redrefs He embarked that year in a Lifbon packet, the Hanover, in order to make the tour of Portugal ; when the veffel was taken by a French privateer. "Before we reached Brelt (fays he*) I fuffered the extremity of thirt, not having for above to hours one drop . of water, nor hardly a morfel of food. In the calle at Brelt I lay fix nights upon fraw; and obforving how cruelly my countrymen were ufed there and at Morlaix, whither I was carried next, during the two months I was at Carlaix upon parole. I coricfponded with the Englih prifoners at Ereft, Morlais, and Din.
nan : at the latt of thoictowns were feveral of our hip's Hownes. crew, and my fervant. I had fufficient evidence of their being treated with fuch barbarity, that many hundreds had perifhed, and that $3^{6}$ were buried in a hole at Dinnan in one day. When 1 eame to England. ftill on parole, I made known to the commiffoners of fick and wounded feamenthe fundry particulars, whicis gained their attention and thanks. Remonflrance was made to the French court: our failors had redrefs ; and thofe that were in the three prifons mentioned above, were brought home in the lirt cartel thips. - Perhaps (adds Mr Howard) what I fuffered on this occafion increaled my fympathy with the unhappy people whole cafe is the fubject of this book."

He afterwards, it is faid, made the tour of Italy ; and at his return fettled at Brokenhurt, a retired and pleafant villa in the New Foreft, near I.ymington in Hamphire, having, A pril 25.1758 , married a daughl. ter of Edward Leeds, Efc; of Croxton, Cambidgefhire, king's ferjeant. 'Ilhis lady died in $1,-6$; in child-bed, of ber only child, a fon, who unfortunately became lunatic. After her death Mr Howard left Lymington, and purchafed an eftate at Cardington, near Bedford.
"While he lived here in retirement (fays Mr Palmer $\ddagger$ ), it was his meat and drink to make his neigh - F Funeral bours happy. His neat but humble manfion was ever Sermons on hofpitable to a few Celect friends, but was never the the death of fcene of tiot or luxurions banqueting. Thoug! polite ard. to all, he neicher fought nor admitted the eompany of the profligate, however dittinguilhed by rank or for-tune.-His charity had no bounds, except thofe of prudence; and was not more commendable for the extent of it, than for the manner in which it was cxercifed. He gave not his bounty to countenance vice and idlenefs, but to encourage virtuc and iaduftry. He was fingularly uieful in furniming employment fur the labouring poor of both fexes, at thofe reafors when a farcity of work rendered their fituation mot conpaftionable. And at other times, though never inattentire to the tale of wo, he was not eafily impored upon by it, but made limfelf acquainted with the cafe. He had indeed a general acquainance with the cafes and characters of the poor around lim, and made it his bufinefs to vifit the abodes of afliction. In circumilances of bodily difordur he often acted the part of a phyfician as well as a friend. But his kindnefs was not contined to the bodies of his fellow-creatures, it extended to their firitual and immortal part. He carefully watched over the morals of has neighbourhood, and ufed his advict, his admonitions, and influence, to difcountenance immorality of all kinds, and to promote the knowledge and practice of religion. As a mol cffectual means to this great end, he provided for the inftracion of poor children, by crecting and fupporting fehools, which be carefully fuperintended. In thort, he was a univerfal bleffing to the vitlage where he relided, in every part of which are to be feen the plating monuments of his menificence and talte.-His liberality exiended allo to adjaeent places, in which there are many who will call him bletted. Nor was it confmed to pertons of his own religious perfuahon, but comprehended the neceflitous and deSersing of all parties; white he was particularly ufeful in ferving the interett of the Chriftian fociety to
which

Howerd, which he belonged. What wonder if fuch a man were univerfally bloved? Was it pofitle he thould have an enemy? One however he had (and I never heard of mure), an idte and diffotute wretch, who, having been often reploved by him for his vices, formed the defperase refolution to murder him as he was going to fublic warhip, which be almolt always did on foot. But Proviluce remarkably interpofed to preferve fo Whable a life, by inctinine him that moming to go on horkback a difirent ruad."

But the fphere in which he had hicherto moved was too uarrow for his enlaryed mind. Being named in 1753 to the office of therif of Bedfordhire, from that cime his feene of ufefulnets was extended. His office, as he himpelf obferves, brought the diltects of prifoners mare immediately under his notice. A fente of daty indaced him perfunally to vifit the county gat, whete he obferved fuch abufes, and fuch feenes of calamity, as he had before no conception of; and he foon ceserted himfelf in order to a reform. With a view to , beain precedents for certain regulations which be purpofed, the went to infpect the prifons in fome neighbouring countics. But finding in them equal room fur complaint and conmiferation, he determined to vilie the principal prifons in England. The farther he proceeded, the more thocking were the feenes prefented to his view: which induced him to refolve upon excrting hisafelf to the urmolt, in order to a general reform in thefe horrid places of confinement; confdering it as of the highele importance, not only to the wretched oljoces thenfelves, but to the community at large. Upon this fubject he was examined in the houfe of commons in March 1774, when he had the honour of their thanks. This encouraged tim to proceed in his defign. He revified all the prifons in the kingdom, together with the principal honfes of correction. He alfo in 1705 endarged his ciscuit by going into Wates, Scutland, and reeland, where he found the fanse need of teformation.

One grand whjeit which he had in view was, to put a llop to that mocking dillemper called the jailfiver; which raged fo dreadfully in many of the prifions, as to render them to the lati degree offenfive and dangerous: A dittemper, by which more had been taken off than by the hands of the executioner: and which, in feveral inftances, had been communicated from the prifoners into the courts of juftice, and had proved fatal to the magilisates and judges, and to multitudes of perfors who attended the trials, as well as to the families of difcharged felons and debrors. A. nother end be propofed was, to procure the immediate rcleate of prifoners, who, upon trial, were acquitted, but who often continued long to be unjunly detained for want of being able to pay the accultumed fees: As alfo to abolifh many other abfurd and cruel ufages which had tong prevailed. But the great object of all was, to introduce a thorough reform of morals into our prifons; where he had found the molt Alagrant vices to prevail in fuch a degree, that they were becone feminaries of wickednefs and villany, and the molt formidable nuifances to the community; in confequence of the promifcuous in. tercourfe of prifoners of boih fexes, and of all ages and defcriptions; whereby the yumg and hefs experienced were initiated, by old and hardence funcrs, into all the
arts of villany and the myfteries of iniquity; fo that, inHead of being reformed by their confmement (which thould be the chief end of punithment), thofe that were difcharged became mure injurions to fosiety than before.

In order to the attainment of thefe great objects, Mr Howard fpared no pains nor espence, and cheerfully expofed himfif to much inconvenience and hazard ; particularly from that malignant diltenper, of which he faw many dying in the moll loathfone dungeons, into whichanne, who were not obliged, belides himfelf, would veature. "I have been frequently (fays Mr Howard) atked what precantions 1 ufe to preferve myfelf from infection in the prifons and thofpitals which I vifit. I here aafwer, next to the fiee goodnefs and mercy of the Author of my being, temperance and cleanlinefs are my peefervatives. Truming in divine Providence, and believing myfelf in the way of my duty, I vifit the mot nosious cells; and white thus employed, I fear no ceil. I never enter an hofpital or prifon befure breakfalt; and in an offenfave room, I feldom draw my breath deeply."

His laudable endeavours he had the pleafure to fee, in fome intances, crownel with fuccefo; particularly in regard to the healthinefs of prifons, fome of which were rebuilt under his infpection. Through his interpofition alfo, better provifion has been made for the ir.itruction of prifoners, by the ineruduction of bibles and other pious books into their cells, and a more conflant attendance of ciergymen. The gaolers likewife have, by aet of parliament, been rendered incapable of felling flrong lignors, which had been the fuurce of much drunkenuefs and diforder. But a minute detail of particulars is not to be expected ha re; for the fe the reader is referred to Mr Howard's publications, which thow that much is get wanting

Bat in order to a more general and happy regulation, and the reformation of criminals, he determined to vifit other countries, to fee the plans there adopted; in hope of collecting fone information which might be ufeful in his own country. For this purpofe he travelled intu France, Flanders, Holland, Germany, and Switzerland. Afterwards through the Pruffian and Amftrian dominions. He vifited alfo the capitals of Deumark, Sweden, Ruffia, and Poland, and fone cities in Portugal and Spain. In all thefe expenfive and hazardous journeys, he denied himfelf the ufual gratifications of travellers, and declined the honours whicks were offered him by perfons of the firf diftinstion, applying himfelf foldy to his one graud object. Tou him the infpection of a jail, or hofpital, was more grateful than all the entertainments of a palace. With what aftonilhment and gratitude he was received by their miferable iuhabitants may eafly be imagined, fince while he made effervations on their fituation, he meditated their relicf; and many diftreffed prifoners abroad, as weil as at home, partook of his bounty, and fonse were liberated by it; for he confidered all of every nation, and people, and tongue, as brthren. Nor was he fparing of advice, or of reprouf, as he faw occafion, to perfons of rank and influence, whertby the miferics of their countrymen might be relieved. As he courted the favour of none, neithor did he fear the frowns of any; but, with a manly freedom and a Cbritian fortitude, fooke his mind to crowned heads
(parti-

(particularly the late emperor of Germany) in a manner to which they were not acculoned; which, however, in a perfon of fuch difinerelled views, procured him reverence and tferm, and in fome inflances proved effectual for relieving the niferable and oppreffed. On his return, he publifhed in 1777, "The State of the Prifons in England and Wakes, with Prcliminary Obfervations, and an Account of f:me foreign Prifons." fto. And in 1778 he took a third journey through the Pruffian and Atitrian dominions, and the free citics of Gernany, and likewife extended his tour through Italy, and revifited fome of the countries he had before feen. The obfervations lee made in this tour were publifhed in an appendix, 1;82; containing alfo fome remarks refpecting the management of prifoners of war, and the hulks on the Thames. But wifhing to acquire fome further knowledge on the fubject, he in $1-81$ again revifited Holland and fome citics in Germany. He vilitedalfo the capitals of Denmark, Sweden, Rufia, and Poland; and in 1,83 fome cities in Portugal and spain, and returned through France, Flanders, and Holland. The fubilance of all thefe travels was afterwards thrown into one narrative, which was publihed in $1-84$. He allo publifhed a curious account of the Batlile, in 8vo; that infamous French prifon happily now no more.

Histravels and exertions, how ver, were not yet at an end. He conceived a further defign, which was to vifit the principal lazarettos in France and Italy, in order to obtain information concerniug the bell me. thods to prevent the fpreading of the plague, with a view to apply them with refpect to other infectious diforders. Not gaining ail the fatisfaction here which he wifhed for, he proceeded to Smyrna and Conftantinnple, where that moll dreadful of human difempers actually prevailed, "pleating hiinfelf (as he faid) with the idea of not only learning, but of being able to communicate fomewhat to the inhabitants of thofe diflant regions." In the execution of this defigr, thungh he was fo much expofed to danger, and aftually caught the plague, "that mercifut I'rovidence (as he himfelf piouly remarks) which had hitherio preferved him, was pleafed to extend his protection t. him in this journey alfo, and to bring binn home ouce more in fafety." In bis return he revilited the chief prifone and hofpitals in the countrits through which he paffed ; and afterwards went again to Scotland, and then to Ireland, where he propofed a now and very important object ; namely, to infped the Proteflant Charter Schools, in fome of which he had before obferved mameful abufes, which he had reported to a committee of the Lrih Houfe of Commons. In this more extenfive tour, he took a particular account of what he obferved amifs in the conduct of this noble charity, with a view to a reformation, and not without confiderable fuccefs. la the cotirfe of thefe journeys, particular citics and communities were not unmindful to pay him proper refpect. At Dublin, he was created by the univerliny a Doctor of Laws; and the city of Glafoow and the town of Liverpool did honour to themfelves by enroling him among their members. Upon his return home, having again infpected the prifons in England, and the hulks on the Thames, to fee what alserations had been made for the ketter (which he found to be very coniderable, though yc:
imperfect , he publined the refult of his laft laborious Hows:d. invertigations, in "An Account of the principal Lazarettos in Europe, with various Papers relative to the Plague, rogether with further Oblerwations ore fome Foreign Prifons and Hofpitals, and additional Remarks on the prefent State of thofe in Great- Britain and Ireland," with a great number of curious plates. The work likewife contained Obfervations on Penitentiary Houfes, which had been encourazed by act of parliament, for the correction and reformation of criminals, of which he and Dr Fothergill had becn nominated by the king to be fuperintendants. Belide thefe, hee publithed the Grand Duke of Tufcany', "new Code of Criminal Law with an Englifh Tramlation:" and of all his publications he gave away a valt number of copies among his acquaintance in the moft liberalmanner. His laying open the horrors of defpotifm in a neighbouring country had very nearly expofed him to the fulferings of them; and had it nut been for the timely notice of our ambatidor, he hate ended his days in the laflite.

Not fatisfied, however, with what he had already done, he conclades his "Accomnt of Lazarettos" with announcinc has "iatention again to quit his country, for the purpoie of reviliting Ruflia, 'Turkey, and fome other countries, and extensing his tour in the Eat. I asn mat infenfible (fays he) of the dangers ihat muk atund fuob a journey. Trulting, howeser, in the protection of that hind Providence which has hitherto preferved me, I calmly and cheerfully conmit myfelf to the difpofal of unerring wildom. Shoula it pleafe Gos to cat off iny lifes in the profecusion of this difign. let not my conduct be uncandidly in puted
 conviction that I ampurfuing the path of duty, and to a lincere defire of being made an instrument of more extentive ulifuluefs to my fellow-creatures than could be expected in the narnower eircle of a retired life." Accordinsly, to the great concern of his fricuds, he fet out in fummer 1 ; 8 g on this hazasdous enterprize; the pinincipal ubject of which was to adminitere a medicine in hugh repute at home, in malignant ferers ${ }^{\top}$, "Drjaneses under a Arong pertiafion that it would be cqually etti- Fouds. caciuus in the plague. In this focond tour in the Eatt "it did pleafe God to cat of his life:" for, having fpent forne sime at Cherfon, a now feetement of the Emprefs of Ruffia, in the raouth of the Duicper or Borythencs, towat the no: thern extremity of the Black Sea, near Oczakow, he caught, in vifiting the Ruffian hofpital of that place, or as fome fay a young lady who was ill of the fame complaint, a yualignart fever, which carried inim cif wathe 20 th of January, after an ilhutfs of akout twelve days: and aticr liasving been kept, accurding to his exprefs dirceiuns to his fervant, five dajs, he was buried, by his uwn de. lire, in the garden of a villa $!$ the neighbuurhoud, belonging to a French gratuman from whon the had reccived great civilites, by his faithful fervant who had. attended him on his forace jumeneyings, and whom he exprefsly eajoined fut :o reatn home till tive wecks from his death. White at feus on his latit tour to 'lut. key, ECo his chatacter for astive benevolsace had io much attracted the pablic atemtion, that a futiaip. tion was fet on fout to ence a latuc to his honour, dind

Howard purpofe. But fome of thofe whoknew Mr Howard beit, never concurred in the foheme, being well affared that
le would neither conterance nor accede (o) it ; and in condrquence of two leters inom Mr Howard himedft to the Iubfenthers, the delign was laid atide. It has, however, been refumes dince his death : And fursij, of all the flatues or monuments ever erected by public gratitude to ithultrious characturs either in ancient or modern times, none was ever erecied in hononn of worth fo genuine and admirable as his - who deroted his time, his Arength, his fortune, and thally facrificed his life. in the purfuits of humanity : -who (to adopt the expreflive words of Mr Purke $\ddagger$ ) " vifited all Europe [and the EatH], not io furvsy the fumptuoufnefs of palaces, or the datelinelis of emples; not to make accurate meafurements of the remains of an- cient grandeur, nor to form a feale of the curiofity of modern art ; not to collect medals, or so eollate manaferipts; but to dive into the depth of dungeons; to flunge into the infection of hofpitals; to mervey the mantions of formow and of pain; to take the gauge and dimentions of mifery, depreftom, and comempt; to remember the forgotten; to attend to the neglected; to vilit the fordaken ; and to compare and collate the diltefles of all men in all countrits. IHis plan is original ; and it is as full of genius as it is of humanity. It is a royage of difcovery, a circumnavigation of charity; and already the benetit of his labour is felt more or lefs in every country."

HOWDEN, a town in the Eaft Riding of Yookmire, 180 mikes fiom London. Atands on the morth fide of the Oufe, has a market on Saimrdays, and four fairs in the year. Here was formerly a collegiate church of five puebendaries, erceied in the lath century but one ; adjaccut to which the bifhops of Durham, who poffels many effates hereabouts with a temporal jurifdiction, have a palace. One of them buite a very tall fleeple to the chureh here, whither the inhabitanes might retire in cafe of inundations ; to which it is very liable from the great frethes that ceme down the Oule fometimes at abb. This part of the county is from hence called Howdenflire, and is watered by a conlux of feveral large rivers that fall into the Humber. At Huwdendike is a lersy urer the Oufe.

HOWE (John), a learned Englith nonconformit divine bern in 1630. He became ninitur of Great Torrington in Devonfhire, and was appointed houlchold chaplain to Cromwell ; but feems to have been feee from the lanaticilm then in fahion, as he offended Cromsell greatly by praching againtt the notuon of fatticular faith, which the minitlets of his court were ereat adrocates for. When Oliver died, he comtinned chaptain to Richard; and whitn Richard was depoted, he atturnad to 'lomiagom, where he centinued thll the aet of miformity took flace and fet hims afode. He afterwards feated at Utreche, until the declanation fo: liberty of confeience was publifhed by king James [l. under hacter of whech he returned to London, where he died in 1705 . Ne publifsed a great numbu of lermons and religions works, which have been teprinted together in two vols folio.

How' Ifland, a fmall ihard of the South Sca, dif. covered by captain Wallis, called by the intrabitants
 and W. Long. 15\%.8.

Lorel Thars's IJhond, a finall inand in the neighbourhood of Aew South Wales, difcovered on lebruary 17.1733 , S. Lat. $3^{1}, 36$. E. Lang. 159. O4. It is of an arched ligure, lying from northewelt to Couth eatt, the wo extmemites incluaing a fpace of about in miles, though, by 1 cafon of the curved figure of the illand itfelf, it is near feren in length. It is deeply moented on the midile of the eaftern part by a buy named Rofs's Bay, and on the oppofite and wettern part has another named Prace William Hen. ry's Bay; fo that the whole has the appearance of two illands joined together by an ithmus, which in fome places is not aboee half a mile broad. On the fouthcrn part of thas divilion which lies moll to the northward ate two confiderable bays, named Callam's and Hunter's Bay; and on the fouth-wellern part of the other are two high mountains, the moll foutherly named Mount Gower, and the other Mount Lidgbird. The convex part of the illand lying towards the northcalt, and the concave lide towards the oppolite quarter, is terminated by two points named Point King and Point Philip. No frefh water was found on the illand; but it abounds with cabbage-palms, mangrove, and manchincel trees, even up to the fummits of the mountains. There are plenty of ganets, and a land fowl of a dulky brown coluur, with a bill about four inches long, and feet like thofe of a chicken. Thefe were found to be remarkably fine meat, and were very fat. There are many large pigeons, and the white birds found in Norfolk Illand were alfo met with in this place. The bill of this bird is red, and very ftrong, thick, and farp pointed. Great numbers of fine turtis frequent this inand in fummer, but go to the nothward in winter. Thefe, it was imagined, would prove of great fervice to the colony at Purt Jackfu; but, from fome caufe or other, it appears they have hitherto been difappointed. Plenty of tilh were caught by a hook and line. At the diftance of about four leagues from Lord Howe's lflasd is a very remarkable and high rock, to which the name of Ball's Pyramid has been given. This illand may ve approached without danger; but about four miles from the fouth well part of the pyramid the te is a very dangerous rock, which fhows iffelf above the furface of the water, and appears nut to be larger than a boat. The louthern part of the ifland is lined with a fandy beach, which is guarded againt the fea by a reef of coral rock, at the diHance of half a mile from the beach, through which there are feveral fmall openings for boats; but there is nowhere a greater depth of water within the reef than four iect. By the acconnt of Mr Watts, who vifited this ifland in his return from Port Jackfon, the ithmus which joins the two parts has cridenty been overflowed, and the illand disjoined, as in the very centre the men faw large beds of cornl rocks and great quantities ut fhells; and on the eat, which leems in general to be the weather-fide, the lea has thrown up a bank of fand from 25 to 30 fect high, which ferves as a barrier agandt future inundations. 'The illand alfo appears to have fuffered by volcanic eruptions, as great guantites of puntice thones and other matters of that kind were found upon it. Mr Aukin alto found the whole reef which flelters the wetl bay a burne-up nafs. The time he vilited the illand was chat of the mevoition of the ganets, of when there were then prodigi-

## H O Y [ 703 ] H U A

ous numbers, their nells being only hollows made in the fand, there not being any efuadrupeds on the ifland to difurb them. Befides the large pigeons already mentioned, they mutt with betatiful partits and parroquets; a new fipecies of the coote, as well as of the rail and magpie. They found likenife a very beautiful fmall tird of a brown colour with a yellow breaft, and yellow on the wing, which fecmed to be a fpecies of humming bird. They fund a? fo a black bird like a fleerwater, having a hook d till: and which burrows in the grourd. The only infects met with here were the common earth worm and ants; which laft were in geat pleaty. Liefids sthe trees aheady mentioned, they found feveral efculent veretables, as feurvy grafe, celery, finach, endive, and farmphite.

HOWEL (James), a coluninous writer of the 17 th century, fuppotted himfelf inany years by writing and tranflating of books. Though he had been a zealous loyalif, he afterwards flateced Cromwell; zet on the reftoration he was made hifloriographer to the king, being the firt in England who enjuged that title. He died in 1606.

HOWIIZ, a kind of mottar, mounted upon a fieldcerriage lihe a gun. The differencebetween a mortarand a howizz is, that the trumbins of the fir! are at the end, and at the middle in the lafl. 'Ile invention of howitzes is of mueh later date than montare, for they really had their originfrom them. The contructions of howit\%es are as variovs and uncertain as thofe of mortare, excepting the chambers, which are all cylindic. They are dittinguifhed by the diameter of the bove; for inflance, a ten inch howitz is that the diamoter of which is 10 inches; and fo of the fmaller ones.

HOWTH, a promontory which forms the northern entrance of the bay of Dublin, having a fmall village about feven miles north eat from that city in the pron. vince of Leinfter. It gives tiole of earl to the farily of St Lawrence, who were fo called from a vietory ob. tained by then over the $\mathrm{I}_{1}$ ifh on St Lawrence's day 1177, their former name being Trillram; and this place has continued in pofition of the tamily above 600 years. N. Lat. ' 3 21. W. Long. 6. 22. The flores off this hill are $10 \mathrm{k} k$ and precipitous. af. fording, however, a few harbours for fmall craft. It was formerly called Ben-hedar, i. e. "the Birds promontory ;" and celebrated for laving Dun Criomtian, or the rath or royal palace of Criomthan ericted en it, he having been chief or king of that dillrict, and tne morable for making feveral fuccefsful defecrits on the coalt of Britain againtl the Romans in the time of in gricola. Howth, though now llipt of trees, was ior: merly covered with venerable craks, and was a fat wi the Druids; one of their altars ftill remains in a fequefiered valley on the eall fode of the hill. The mantionhoufe is built in form of a catte, and was probably erceted by Sir Armoricus Thintram. Nar the hove ftands the farrily chapel, and on the weflern foure ase the ruins of St Mary's church, with fome anciont monnuments of lord Howth's anceltors. Due weft of Houth houfe are the ruins of at Menton's church.

HOY, a fmall veffel, chiefly wied ine afting, or carrying goods to or flom a hip, in a reat or bay, where the ordinary lighters catiat be managed with fatcty or convenience.

It would be very difficult to defcribe, precifely, the marksof diftinction bet ween this veffland fome others of the fame fize, which are alfo rigged in the fame manner; becaufe what is called a toy in one place, would affume the name of a frop or finack in another; and even the prople who navigate thefe veffets, have, upon examination, very yague ileas of the marks by which they are diftinguithed from thofe above inentioned. In Hol. hand, the hoy has two malls; in England, it has but one, where the main fail is fometimes exterded by a boom, and fometimes without it. Upon the whole, it may be defined a fimall weflel, ufually rigged as a floop, and empluyed for carry ing pafiengers and luggage foom one place to another, particularly on the fea-coatt.

Hox, an illand of Scotland, and one of the O:cades. It is ahout 10 miles long; and that part called $W^{\prime}$ aes is fruitful and pretty populous, and is a good place for fighing.

HOYE, atown of Germany, in Weftphalia, and captal of a county of the fame name. It is feated on the river Wefer, and is fubject to the elector of Hanover. E. Long. 9.O. N. Lat. 53.5.

HUAHINE one of the Sourtr- Iflants, in the Suath Sea, firuated in S. Lat. 16. +3. W. Long. 150 52. and is abuit feren or eight leagueg in compafs. Its. furface is biliy and unven, and it has a fate and convenient hathent. It was birt difeovered by captain Cook in 1769. It is divided by a deep inlet into two perimfulas cumected by an ithmus, which is entirelv overflowed at high watcr. From the appearance of its hills it may be cuncluded, that the country lasat fome period or stherbeen the tat of a volcano. 'The fummitof one of them had much the apparance of a crater, and a blackith fongey es. .h was feen upon one of its fides, which fumed to be lava; and the rocks and clay every where had a burnt appearance. The ifiand is plentifully fupplied with water by many risukts which defetend from the mountains and broken rocks. The inhal itants are nearly as fair as Europeans; and their conciuct is bolder than that of the inhabitants of the other Suciely thands. They are a tout large made prople. fume of the tallef being fix feet three inclies in height; they are extremely indolent, and feem to lide as little curioficy as fear. The dogs are in greas favour with all theil women, "who could not have careffed them (fays Mr Forter) with a more ridiculoas aftection if they had bren European ladies of fathion." Here was feen a midele aged woman, whofe brafts were full of milk, offring them to a little puppy who hed been trained uptor fuck them. The fight difguited thofe who fats it fo mucl, that they could not forbear exprefir ; encir diflike to it; but the woman fmiled, and twid them that the allowed young pigs to do the fame It appeared afterwards that this woman lad loft her child. Sume of the gentemen were prefont at a dramatic entertainment on this illand: the picce reprefented a girl moning away from her parents; and feemed to be teselled at a female pafienger who liad come in captain Cook's Rip from Otaheite, and who happened to be prefent at the reprefentation. It made luch an impreflion on the girl, that the gentlemen could fearce prevall upon her to fee the piece out, or to rsfrain from tears while it was atting. It concluded with the reception fie was fuppofel to meet with from

## H U D

Ehiler her friense, which was made out not to be a very anucolic one.-Thefe feeple introduce extempore Ficce upon oceafon; and it is moll probable that this was w cant as a fatire upon the girl above onentioned, ans. to difcounge others from acting in the fame manner.

HLPBER (Uhric), one of the greated cinilians in the 1 oth century, was born at Dockum in 1636. He became proteflor of law at Francker; and wrote, I. A
 3. Spcimen poblofoflie civilis. 4 Infinationes bijlora ci-- \% ; and leveral other works which are ettecnicd. He died in $169+$.

HUBERT (St), a town of the Nethorlands, on the confines of Liege, with a very line abley, where they bring thofe that are bit by mad animals to be cared. E. Long. 5. 25. N. Lat. 34. 32.

HITBNER (John), a learned geographer of Germany, taught geography at Leiphic and llamburg witl extraordinary reputation ; and died at Hamburg in 1532, aged 03. His principal wook is $\Lambda$ Geographical treatife, printed at Bafil in $15+6$, in 6 vols 1 zino.

HUDSON (JAfrey). Sec Dware.
Hudson (Hemry), an eminent lenghthavigator, who, about the begimning of the laft century, undertook to find ont a pallage by the north taft or northwent to Japan and China. For this purpofe he was Gar times fited ont: he returned three times malucstobl; but in the lat woyge, in s 万oro, being perfraded that the great bay to which his mame has been fince given, mut lad to the paffage he fought, he whatered there, to profocute his difcovery in the futig. Jut their ditreffis during the winter produ--ing a mutiny among his mon, when the fprime arri. wh, lhey turned him, with his fon and leven lick men, adrift in his own thallup, and procecded home with the flap. As Hudfon and his unhappy companions wore nuty heard of afterward, it is to be fuppoind tley all perimed.

Hunson (John), a very learned Englin critic, 1, m in 1 ( $n 2$. He dikinguilhed himfelf by feveral aluable editions of Greek and Latin authors; and, in :-01, was clected head keeper of the bodkian lihams at Oxford. Ia 1712 , he was appointed prin. cipal of St May's Hall, throwg the interef of the fumous Dr Ratcliffe; and it is Caid that the univerfity ,if Oxford is indebted for the noolt ample benefactions of that phyfician to Dr Hudfon's folicitations. He ciud in $1-19$, while he was preparing for puhlication a catalogue of the Bodkian library, which he had canfers to be faitly tranferibed in fix folio volumes.

S'toson's. Bay, a large bay of Neth America, lyine between 5 t and ky degrees of latitude, difcovered in $\mathrm{I}_{51}$ by Henry Hudion. This intrepid mariner, in fearnhing after a north-well paffage to the South-feas, elifoovered three thaits, throngh which he hoped to find vut a new way to Alia by America. He had made tivo royages before on the fame adventure; the firll in 1607 , and the fecond in 1608 . In his third and latt, 1610 , lre cntered the ftraits that lead into this new Mediterranean, the bay known by his name; coalted a great part of it ; and penttated to cighty degrees and an half into the heart of the frozen zone. His ardour for the cifcovery not lecing abated by the difficulties he Ituggled with in this empire of winter, and
$N^{3} 158$.
world of frof and fnow, he Aaid here until the enfuing furing, and prepared in the beginning of 1611 to pulue his difcoveries ; but his crew, who fuffered equal hardhips, without the lame fpirit to fupport them, wutisicd. feizerl upon him and feven of thefe who were molt faithful to him, and committed them to the fury of the icy feas in an open boat. Hudfon and his companions were either fuallowed up by the waves, or gaining the inhofpitable coatt were deftroyed by the cavages; but the hip and the reft of the men retumed home. Other atiempts towards a difcovery were nade in 1612 and 1667 ; and a patent for planting the country, with a charter fur a company, was obtained in the year 16,0 . In 1746 Captain Ellis wintered as far north as 57 degrees and a half, and Captain Chritopher attempted farther difcoveries in 1761. Lout behdes thele and the late voyages, which fatisfy us chat we mull not look for a palfuge on this fide of che latitude 67 degrees noth, we are indebted to the Hudfon's Bay Company for a journey by land; which throws much additional light on this matter, by affording what may be called demondration, how much farther north, at leaft in fome parts of their voyage, hlips mult go, before they can pals from one fide of Anerica to the other. The nerthern Indians, who come down to the company's factories to trade, had brought to the knowledge of our people a river, which on accomut of much copper being found near it, had obtained the mame of the Coppermine river. The company being defrous of examining into this matter with precifion, directed Mr Hearne, a young gentleman in their fervice, and who having been brought up for the nasy and ferved in it the war before lalt, was extremely well qualified for the purpole, to proceed over land muder the couvoy of chofe Indians, for that river, which he had orders to furvey if pomble quite down to its exit into the fea; to make obferva. tions for lixing the latitudes and longitudes; and to bring home maps and drawings both of it and the countries through which he fould pafs. Accordingly Mi Hearne fet out from Prince of Wales's Fort, on Churchill river, latitude $58^{\circ}+7 \frac{3}{2}^{\frac{1}{2}}$ North, and longitude $9 t^{2} 7^{\frac{1}{2}}$ Weft from Greenwich, on the 7 th of December 1770 . On the 13 th of June he reached the Copper-mine river, and found it all the way, even to its exit into the fea, encombered wirh hoals and falls, and emptring itfelf into it over a dry flat of the hore, the tide being then out, which feemed by the edges of the ice to rife about 12 or $1+$ feet. This rife, on account of the falls, will carry it but a very fmall way within the river's mouth, fo that the water in it had not the lealt brackith talle. Mr Hearne was neverthelefs fure of the flace it emptied itfelf into being the fea, or a branch of it, by the quantity of whalebone and feal Niins which the Eifquimaux had at their. tents; and alfo by the number of fals which he law upon the ice. 'The lea at the river's mouth was full of iflands and thoals as far as he could fee by the aflittance of a pocket telefope; and the ice was not yet (July 17th) broken up, but thawed away only for about three quanters of a mile from the fhore, and for a little way round the illands and thoals which lay of the siver's mouth. But he had the mott extentive view of the fea when he was about eight miles up the river; from which Itation the extreme parts of it bore N. Wr. by

## H U D [705] H U D

fron's by W. and N. E. By the time Mr Hearne had finihed ay. his furvey of the river, which was about one o'clock in the morning on the 18 th, there came on a very thick fog and drizzling rain ; and as he had found the river and fea in every refpect unlikely to be of any utility, he thought it unneceffary to wait for fair weather to determine the latitude more exactly by obfervation ; but by the extraordinary care lie took in obferving the courfes and diftances, walking from Congecathawhachaga, where he had two very good obfervations, he thinks the latitude may be depended on within $20^{\circ}$ at the utmoft. It appears from the mas which Mr Hearne conftrueted of this fingular journey, that the mouth of the Copper-mine tiver lies in latitude $72^{2} \mathrm{~N}$. and longitude $25^{\circ} \mathrm{W}$. from Churchill river: that is about $11^{\circ}$ W. of Greenwich. Mr Hearne's journey back from the Copper-mine river to Churchill lafted till June 3oth 1772 ; fo that he was abfent almoft a year and feven months. The unparalleled hardihips he fuffered, and the effential fervice he performed, met with a fuitable reward from his mafters, and he was made governor of Prince of Wales's Fort on Churchill river. But though the adventurers failed in the original purpofe for which they navigated this bay, their project, even its in failure, has been of great advantage to this country, as is fhown under the article Company (Hudfon's Bay.)

The country lying round Hudfon's Bay is called Nez Briain, or the country of the Efquimaux ; conprehending Labrador, now North and South Wales. The entrance of the bay from the ocean, after leaving to the north Cape Farewell and Davis's Straits, is between Refolution ifles on the north, and Button's ifles on the Labrador coaft to the fouth, forming the eaftern extremity of the flraits diltingnifhed by the name of its great difcoverer. The coattsare very bigh, rocky, and rugged at top; in fome places precipitous, but fometimes exhibit large beaches. The ifles of Salifury, Nottingham, and Digges, are alfo very lofty and naked. The depth of water in the middle of the bay is a hundred and forty fathoms. From Cape Churchill to the fouth end of the bay are regulars foundings; near the fhore fhallow, with muddy or fandy bottom. To the north of Churchill the fonndings are irregular, the bottom rocky, and in fome parts the rocks appear above the furface at low water. From Moofe river or the bottom of the bay to Cape Cluurchill the land is flat, marfly, and wooded with pines, birch, larch, and willows. From Cape Churchill to Waget's Water the coafts are all high and rocky to the sery fea, and woodlefs, except the mouths of Pockerckerko and Seal rivers. The hills on their back are naked, nor are there any trees for a great diftance inland.

The mouths of all the rivers are filled with fhoals; except that of Churchill, in which the larget Mips may lie : but ten miles higher, the channel is obftructed with fand-banks; and all their rivers, as far as ha3 been navigated, are full of rapids and cataracts from ten, to fixty feet perpendicular. Down thefe rivers the Indian traders find a qquick paffage; but their return is a labour of many months. As far inland as the company have fettlements, which is fix hundred niles to the welt, at a place called Hudion Houfe, lat. 53 . long. 106.27 from London, is flat country : nor is it Vol. VIlf. Part 1 I.
known how far to the eallward the great chain feen Hudfon's by our navigators from the Pacific Ocean branches off.

The climate even about Haye's river, in only lat. 57, is during winter exceffively cold. The fnows begin to fall in October, and continue falling by intervals the whole winter; and when the frof is moft rigorous, in form of the fineft fand. The ice on the rivers is eight feet thick. Port-wine freezes into a folid mafs; brandy coagulates. The very breath fell on the blankets of the beds in the form of a hoar frof, and the bed-cloaths often were found frozen to the wall. The fun rifes in the fhorteft day at five minutes paft nine, and fits five minutes before three. In the longeft day the fun rifes at three, and fets about nine. The ice begins to difappear in May, and hot weather commences about the middle of June, which at times is fo violent as to fcorch the face of the hunters. Thunder is not frequent, but very violent. But there muft be great difference of heat and cold in this valt extent, which reaches from lat. 50. 40 , to lat. 63 north. During winter the firmament is not without its beanties. Mock funs and halos are not unfrequent; they are very bright, and richly tinged with all the colours of the rainbow. The fun rifes and fets with a large cone of yellowith light. 'The night is enlivened with the Aurora Botralis, which fpreads a thoufand different fights and colours over the whole concave of the iky, not to be defaced cuen by the fplendour of the full moon; and the flars are of a fiery reelnefs.

The eaftern boundary of the bay is Terra di Labrador; the northern part has a flraight coaft facing the bay, guarded with a line of incs innumerable. A vaft bay, called the Archiwinnipy Sea, lies within it, and opens into Hudfon's Bay by means of Gulph Hazand, through which the Beluga whales dart in great numbers. Here the company had a fettlement for the fake of the fimery, and for trading with the Efquinaux ; but deferted it as unprolitable about the year 1758 or 1759. The eaftern coalt is barren patt the efforts of cultivation. The furface is every where uneven, and covered with maffis of stone of an amazing fise. It is a country of fruitlefs valleys and fightiful mountain, fome of an altonifhing height : the lirlt watered by a chain of lakes, formed not from fprings but rain and fnow, fo chilly as to be productive of only a few finall trout. The mountains liave here and there a blighted fhrub, or a litrle mofs. The valleys are full of crouked ftunted trees, pines, fir, birch, and cedars, or rather a fpecies of Juniper. In lat. 60, on this coalt, vegetation ceafes. The whole fhore, like that on the wert, is faced with illands at fome dillance from laud. The inhabitants among the mountaius are Indians; alung the coalts Efquinaux. The dogs of the fonmer are very finall; of the latter large, and headed like a fox. Notwithtanding they have rein deer, they never train them for the fledge; but apply the do s to that uf. Walrufes vifit a place called Nuchwink, in lat. 6c, during winter; from thence the natives purchafe the teetb with which they head their darts. Davis furf pected that he had found a paffage on this coall, in 1586, to the Weftern ocean; but it proves no more than a deep bay.

The laudable zeal of the Moravian clergy induced then to fend, in the year $1-52$, miflionaries from

[^19]Haifin's Greeriond to this country. They fixel on Nifot's
but the find party was Bay habuth fotheir fettement; but the finf party was Hucteris. puttly hilicd, fandy driven away. In 1764 , waler the ——— pociction of our govelbment, another attemg was made. The millionarits were wall recived by the Efquinans, and the mifion groes ch with fuccefs.

The animals of thefe comeries are, the nowe deer,
 tocaves, ottocs, haxee, mations, fyuitrels, cmins, wild cats, and hutcs the einderer fafs in wall herds towards the nenth in Oefuber, fecking the extranc cold. The male piner bears wow out at $k$ a, of the tlonting ice, nout of the viriter, and till June: the furates lie conecalded in the vood, or beluath the banks of tiwers till Manch, when they come ahrowl wihthair twin cubs, and bead their courfe to the $\mathrm{f}_{\mathrm{a}}$ a in fearch of thair confute. Sociral are killed in their pallage : and thofe which are wembed fow valt fury, roar hidecmity, and bite and throw up into the sir even their own progeny. The females and the young. when not inserrupted, continte their way to fea. In June the males retun to fhore, and by Auzut are juined by their conforts, with the cubs, by that time of a confiserable face. The feathered kinds are, geefe, butards, ducks, partridges, and ail manner of wildfowls. Indeed mulcitudes of birds retire to this reremote country to Lablodor and Newfoundland, from places mutt remetely fouth. perhaps from the Antilles; and fome even of the molt delicate little fpecies. Moll of them, with numbers of aquatic fowls, are foen returning fouthward with their young brouds to more favourable chimates. The favages in founc refpects regulate the ir montis by the appearance of birds; and have their goofe month from the vernal appearance of geffe from the fouth. All the grous bind, ravens, cinerecus crows, titmoufe, and Lapland finch, brave the fevereft winter; and feveral of the falcons and owls feek flelter in the woods. Of lifh, there are whales, morfe, feals, cod fifh, and a white filh preferabie to herrings; and in their rivers and freth waters, pike, perch, carp, and trout.

All the quadrupeds of the fe countries are clothed with a clofe, foft, warmfur. Infummerthere is here, asin other places, a variety in the colours of the feveral animals; when that faton is over, which holds only for three months, they all affume the livery of winter, and every fort of beafts, and molt of their fowls, are of the colour of the frow ; cery thing animate and inanimate is white. This is a furprifing phænomenon. But what is yet more furprifing, and what is indeed one of the moft friking things, that draw the moft inattentive to an admiration of the wifdom and goodnefs of P 'rosidence, is, that the dogs and cats from Bitain that lave been carried into Hudfon's Bay, on the approach, of winter have entircly changed their appearance, and acçuired a much longer, fofter, and thicker coat of hair than they had originally.

Hedoson's Bay Confary. See Company.
Hudsow's. Riour, a laige river of North America, which ifes on the eaft of Lake Ontario, and mming by Alhany, and on the back of the fouth falt of New England that ugh part of New-York, fills into the bay of the fea beyond the weft end of Long 1fland, and below the town of New-York.

HUDSONLA, in botany; a genus of the mono-

Eynia order, belonging to the dodecandria ckifs of plants. 'There is no corolla; the caly $x$ is pentaphyllous and tubular: there ale 15 llamina; the caplute is uniloculat, tivaluar, and tritpermous.

HU\& and Cky. in law, the purfuit of a perfon who has committed felony on the high way--Of this cullom, which is of Brith origin, the following deduetion is given by PIr Whitaker. "When it was requifite for the britons to call ont their wariors into the lided, they ufed a methed that was particularly marked by its expechtioufnefs and decilivenefs, and renains fartially araong us to this moment. They raifed a cre, which was immediately caught up by others, and in an indant thanfmetted from mouch to mouth through atl the region. And, as the mate paffed a. long, the warriors fnatched their arms, and hurrici anay to the rendezvous. We hare a remarkable deicription of the fact in Crefar, and there fee the alarn propagated in 16 or 17 hours through 160 miles in a line. And the fane practice las been retained by the Fighlanders to cur own time. When the lord of a clan received imtelligence of an enemy's approach, he immeciatcly killed a guat with his own fivord, dipped the end of a balf-burnt Hick in the blood, and then gave it and the notice of the rendezvous to be carried to the next hambet. The former fymbulically threatened fire and fivord to all tis followers that did not inttantly repair to the latter. The notice was difpatehed from banlet to lambt with the utmoll expedition. And in three or four hours the whole chan was in arms, and aflembled at the place appointed. This was within thefe few years the ordinary mode by which the chieftains alfembled their followers for war. The lirt perfon that reccived the wotice, fet out with it at full fpeed, delivered is to the uext that he me:, who infantly fet out on the fame fpeed, and handed it to a third. And, in the late rebellion of 1745 , it was fent by an unknown hand thrcugh the region of Breadallane; and, flying as expeditioutly as the Gallick fignal in Crfar, traverfed a tract of 32 miles in three hours. This quick method of giving a diffufive alarm is even preferved among ourfclves to the prefent day; but is applied, as it feems from Cxfar's account above to have been equally applied among the Cette, to the better purpofes of civil polity. The batefium and clamesr of our laws, and the bue and cry of our own times, is a well known and powerful procefs for fpreading the notice and continuing the purfuit of any fugitive felons. The cry, like the clamour of the Gauls or the fummons of the Highlanders, is taken from town to town and from county to eounty; and a chain of communication is fpeedily carritd from one end of the kingdom to the other."

HUER, a name given to certain fountains in Iceland, of a molt extraordinary nature; forming at times jets d'eaux of fealding water ninety-four feet high and thirty in diameter, creating the moft magnificent gerbes that can be imagined, efpecially when backed by the fetting fun. Thcy arife out of cylindrical tubes of unknown depths: near the furface they expand into apertures of a funnel fhape, and the mouths fpread into large extent of italactitical matter, formed of lucuffive fcaly concentric undulations. The playing of thefe llupendous fpouts is foretold by noifes rcaing like the cataract of Niagara. The cylin-

hal made heirs to his library. A fevere didemper
weakened his body extremely, but not the vivacity of his genius: he wrote his own life in a very clegant flyle; and died in 1721 , afed 91 . He was a man uf very agrecable converition; anl of great probity, as well as immenfe erutition. - The fallowing are the titles of his principal works. 1. We charis intersue. tibur, at de optima genare interpritamdi. 2. Aa edition of Origen's commentaries on the holy Scriptures, in Graek and Latin. 3. A treatif: on the origin of the Romans. 4. Deimonfratio evangelica, folio. 5. Quefliones Aluetand de concordia rationis et frite. 6. Of the fituation of the terrciltial paradife, in French. 7. A hitory of the conmerce and navigation of the ancients, which has been trandated into Enslin. 8. Comnonarius de rebus a.l eun pertinentibns. 9. Hustiana. 10. Latia and Greek verfes, sec.
HUGILES (John), an ingeniou; and palite writer, was born in 1677 . In the earliett parts of his youth, he cultivated the filter-arts, poetry, drawings. and mulic, in each of which he by turns made a confilerable progrefs; but followed thofe sad his other Atudies only as agreeable amufenctits, under frequent contincment on account of his ill itate of health. The lord Chancellor Cowper made him fecretary for the commiffins of the peace without his krowledge, and diftingui hed him with fingular marks of his etteem. He coatimed in the fame empluyment under the earl of Macelestield, and held it to the day of his death ; which happened in $\mathbf{t 7 1 9}$, the very night in which his tragody, intitled The fage of Dandfous, was lird acted. He was then 2 2. He tranfated Fontenelle's dialogues of the dead, Vertot's revolutions of Portugal, and the letters of Abelard and Eloifa.- He gave a very accurate edition of Spencen's works, with his lifi, a gloflary, and remarks; and wrote feveral papers in the Tather, Spectator, and Guardian. Mr !uncumbe, who married his filer, collected his puems and elfays in 2 vols 12100 , in 1735 .

HUGHLY, a town of Afra, in the kingdon of Bengal, feated on the moft wefterly branch of the river Ganges. It is of large extent, reachiay about two mile along the river-fide, and druves a great trate in all the commodities of that comery; afording rich cargoes for 50 or 60 Mips annually, befices what is brought on carriages to the neighbouring towns. Saltpetre is brourght hither from Pastia in veffels above 50 vards long and five broad. The iuhabitants are chielly Indians; but there are alio Poriugne:C, Eag. lim, and other Europeans. E. Loug. 87. 55. N. Lat. 22. 0 .

HUGO CApet, chief of the thind race of the kings of France, being count of Paris and Orleans: he was raifd to the throne for his military valour and publio virtues in $9^{9} 7$. See France, in 38.

HUGONIA, in botany: A gethus of the decandria order, belonging to the monadelphis clafs of plants; and in the natural method ranking with thofe of which the order is donbeful. The corolla is pentapetalous; the fruit is a phum with a llriated kernel.

HUCLENOTS, z: appellation given by way of contempt to the reformed or Proteltant Calvinits of Fiance.

Tt:e name had its frett rife in 1562 ; but authors are $+\mathrm{T}=$

Hucuenots, not agreed as to the origin and occafon thereof: but Hulk. one of the two following feems to be the leat forced derivacion.

One of the gates of the city of Tours is called the fate Iourgen, by corruption from fou Huror, i. e. the lite Itugen. This Hugen was chice comat of Tours, a.condirg to Eginhardus, in lis he of Cbarles the Great, and to fone other hitorianj. Ite was it feems a very wicked man, who by his fierce and crucl tem. per made himelf drealful: fo that after his death he was fuppofed to walk about in the night-time, beating all thafe he met with: this tradition the jurlicions 'Itharus has not fermpled to menten in his laftory. favila and other hiforians pretend, that the wiekname cif Fhatunots was liril given to the lirench Proteltant, becaufe thay ufed to meet in the night time in fubterraneous valles noar this gate of Hugon; and what fems to combenance this opinion is, that they were firit called by the name of Huguencts at this city of Tours.

Others affign a more illuftrious origin to that nme; and fay that the leagners gave it to the reformed, becaufe they weie for ketping the crown upon the head of the prefent liue deicended from Hugh Capet; whereas they were for giving it to the houle of Guife, at defcended from Chates the Great.
Others again denive it from a French and fanlty pronunciation of the German word eidynoffen, ignifying confederates, and originatly applied to that valiant part of the city of Geneva, which entered into an alliance with the Swifs cantons, in order to mantain their liberties againt the tyranuical attempts of Chartes 11 . culke of tiavoy.

Thefe confederates were called Eignots, whence Huguenets.

The perfection which they underwent has faree its paralle in the hifory of religion: though they obtainif a peace from Henry 111. in 1576, it was only of thort contimance; and their fufurings, mitigated by the famose colict of Nates, granted to them in $159^{\circ}$ by Henry IV. were again rentwed, after the revocation of this edict, by Lomis XIV. in 1685.
I. $1 . \mathrm{K}$, an old fhip of war, fitted with an apparatus, th fix or take out the malls of his majefly's inips, as occafion requires.

The matt of this reffet is extremely high, and withal properly Atrengthened by /brouds and ./ags, in order to fecure what are catted the Joers, which Cerve, as the arm of a crane, to hoill out or in the matts of any Thip lying alongtide. The fheers are compofed of le. veral loug matls. wiofe heels rett upon the fute of the thulk, and having beir heads declining outward from the perpendicular, fo as to hang over the veffel whofe mafts are to be fixed or difplaced. The tackles, which extend foom the head of the mall to the fhere heads, are intended to pull in the latter towards the matthead, particulanly when they are clanged with the weight of a malt after it is raifed out of any fhip, which is performed by fromg tackles depending from the thur-beads. The efter of thefe tachics is produced by two caplterns, fixed on the deck for this purofe.

Heok, is alfo a name befowced on any old vefel laid by is unit fue funther forice. It is probably de.
rived from the onasis, or veffels of burthen, of the ancient Gresians.

HULL, in the fea language, is the main body of a thip, without either malts, yards. fails, or rigging. Thus to firike a IIthl in a llorm, is to take in her fails, ani to lafh the hetm on the lec. fide of the thin: and to louth, or lie cobul, is faid of a thip whofe fails are thus taken in, and helm tathed a-lee.

Hull., a river in Yorklhire, which falls into the Hunber at Kinglon upon Hull. Sce Kingsonv.

HUMAN, in gencral, is an apprilation given to whatever relates to mankind: thus we lay, the human foul, human body, tuman laws, isc.

HUMANITY, the peculiar nature of man, whereby the is rlillinguihed from all other heings.

Humanitiss, in the plural, fignify grammar, rhetoric, and poetry, known by the name of lierere bunuaniores; for teaching of which, there are proler. fors in the univerlities of Scotland, called bomani/s.

HUMBER, a river formed by the Treti," Oufe, Derwent, and feveral other lteans. By the la e e inhad naviration, it has a communication with the tivels Meifey, Dee, Ribhle, Sceern, Thanes, Avon, Scc. whinh navigation, including its windings, extends above 500 miles, in the counties of Lincoln, Nottinghan, York, Lancafter, Wenmoreland, Chelter, Stafford, Warwick, Leiceltcr, Osford, Warcelter. It divides Yorkthire from Lincolnhire, and falls into the German ocean near Holderuefs.

HUME (David, Efq;) a late celebrated philofopher and hiltorian, was born in the fouth part of Scotland on the 26 th of April O.S. in the year $171 t$. Being the younger fon of a country gentleman of good family, but no great fertune, his patrimony was of confoquence infuffisicut to fupport him. For this reafin he was dellined for the bar, and paffed through his academeal courfes in the univerfity of Edinburgh; but being more inclined to lladies of a different nature, he never put on the gown, nor eventook the introductory iteps riceelfary for that puppois. The writings of Locke and Berkeley haud directed the attention of the generality of hanned men towa:d metaphylies; and Mr Hume having; canly applied himfelf to Itudies of this kind, publithed in 1739 the two fint volumes of his Treatife of baman nature, and the third the following year. He hat tie mortification, however, to find his book generally decried; and to perceive, that the talle for fyltematic writing was now on the decline. He therciore divided this treatife into feparate Eflays and Difiertations, which he afterwards publifhed at different times with alterations and improvements.

In $174^{2}$, Mr Hume publifhed two finall volumes, confiling of Ellays moral, political, and literaty. Thefe were better received than his former publication; but contributed litule to his reputation as an anther, and thill lefs to his profit; and his fmall patrimony being now almott fpent, he accepted an invitation from the marquis of Annandate to come and live with him in Enyma. With this nobleman he Itaid a twelve-month; during whichtime his fnall fortune was confiderably inceraled. He then recived an invitation from General St Clair, to attend hom as a kecrealy to his expedition, which was at firl medut againt Cara-

da, but afterwards ended in an excurfion again!t the coalt of France. In 174, he received an invitation from the general to attend him in the fame fation in his military embaffy to the courts of Venna and Turin. He then wore the uniform of an officer; and was introduced at thefe courts as aid deecamp to the gencral, along with Sir Harry Erfine and captain Grant, afterwards general Grant. In 17,9, he retarned to Scotland, and lived two years with lis hrother at hes councry houfe; where he compoted the fecond part of hiseflays, called Political Difourfis. And now the gen, cral approla. tion of his performances was indicated by a more extentive fale than formerly, and likewife by the numerous anfwers puilithed by different perfons in onder to counteract their fuppofed pernicious terdency. In 1752, were publifhed at Edinburgh his Dolitical Dif. courfes, the only work of his which was well received on its firit apparance; and the fame year, at London, his Irquiry concerning the Primeiples of Morals, which in his own opmion was incoreparably the bett of all his ferformances. This year allo he was appointed librarian to the faculty of Advocates at Edinburgh ; the principal advantage refulting from whichemployment was, that he had by that means the command of a large library. He then formed the plan of writing the Hifony of England: but deeming the whole to be too extentive, lie confined his hitory to that of Rritain azater the houfe of Stuart. The book was alnart univerfally decrica on its firt appear. ance, and foon after founcl to fink in oblivion. Dr Herring primate of England, and Dr Stone primate of Ireland, were the omly litcrati of the author's acquaintance who approved of the work, and fent him meffages not to be difcouraged.

Notwithitanding the approbation of the fe eminent men, hawever, Mr Hune's fpirits were fo much funk by his bad fuccefs, that he had forne thoughts of retiring to Fiance, changing his name, and bidding adicu to his own comery for ever; but his defign was rendered impracticatic by the breaking out of the war of 1755 betiveen France ard Britain. He then publifh. ed his Natural Hitlory of Retigion; to which an an. fwer was publifhed, fuon after its appeazance, in the name of Dr Hurd bimop of Litchitid and Cown. try; of which, however, he hath fince diflaimed being the fole author. In 1:56, the fecond volunie of the Hiftory of the Stuarts was publifhec, two years after the appearance of the filt. This was better received, and helped to retricve the character of the former volume. Threc yeats after, his Hifory of the Houfe of Tudor made its aprearance: which was a!moft as ill received as the Hitlory of the Stuats had betn, the reign of Elizabeth beidg particularly ubnoxious. The author, however, bad now learned to defpife popular clamours; and continucd to fiuth at his leifure the more early part of the Englifh hittory, which was publifhed in 1751 , and was received with tolerable fuccels.

Mr Hume being now turned of fify, and having ob. tained by the fale of his books a competent and inde. penderit fortune, retired into his native country of Scotland, deteritired never more to fer his foot out of it. From this refolution, hawever, he was diecreces by the earl of Hertford; whom he attendeld as feeretary on his embalfy to Paris in $1, t_{3}$. In 1765 , the
earl being appointed lord lieutenant of Ireland, Mr. Hume was intruted with the fole manazernent of the butinefs of the Hate till the arrival of the dake of Richmond towards the batter end of the year. In 1767, he recuraed to Edinburgh, with a mach lafyer inco:ne, procured to him by the carl of Hertford, than he formerly had ; and now formed the fane defigu he had formerly entertained, namely, of burying himfelf in his philofophical retreat. In this, however, he was again difappointed, by receiving an invitation from seneral Conway to be under fecretary; and this invitation he was prevented from declining, both by the character of the perfon, and his connestions with lod Hertford. In igog he retutned to Edinourgh, patfufed of L 1000 a year, heahlyy, and though fomse what Ilrcken in years, yet liaving a propect of low 5 enjorying his cafe, and of feeing the increafe of his fiputation. Of his laf illnefs and character, he lamfelf gives the following account. "In fpring 1775, I was Aruck with a difodder in iny howels; which at firll gave me no alarm, but has fince, a. I apprelient it, become mortal and incurable. I now reck on upo i a ípcedy diffolution. I have fuffered very little pain from my difurder; and what is more Arange, have, notwithitanding the great decline of iny perfon, never fuffered a moment's abatencent of my ipirits; infomuch, that ucre 1 to name the period of my life which I hould moth clroofe to pafs over again, I might be tempted to point to this latter period. I panfers the fame ardour as ever in Atuly, and the fame gaiety in company. I confider, belides, that a man of lixtyfive, by dying, cuts off only a few gears of intiomities; and thugh I fee many fymptoms of iny litetary reputation brcaking out at lalt with additional luitue, I knew that I could have but few years to ening it. Is is dificult to be more detached trom life thin 1 am at prefent.
"To conclude, hilorically, with my own character, I am, or rather was (for that is the flyle 1 mull now. ufe in Speaking of mytelt, which emboldens tac the more to fpeak iny fentiments); I was, I fay, a man of mild difpofitions, of command of temper, of an open, focial, and cheerful humour, capable of attachment, but lithe fulceptible of cumity, and of greas mokeration in all my paffinas. Even may love of ii torary fame, my ruling pafion, never foured my temper, notwithitaiading my frequent difappointanctiteMy company was not unacerptatle to the young and carelefs, as well as to the Itudious and literary; and as I took a particular pleafurc in the company of modell women, I had no reation to be difpleafed with the reception I met with from them. In a word, hougit mon men any wife eninem have foand reafon to complasia of calumay, I never was touched, or even attack. ed, by her balefal tovih: and thotgh I wartonly ix. pofed nyfelf to the rage of both civit and religinus factions, they leemed to be difarmed in my behalf of theis wouted bury. My friends nover had oceafion io vind. ca:c any one cimmitiance of my character dad conWuet : not bue that the zalots, we may weil iappone, urovid have beenglad to invont ame prophetic any Alay to my difdrantage, but they chald heme had any which ibey thought wuld wear the face of in... balility. I cannor lay there is no vanity in matin; this furcial utation of aygrat, but 1 hoge it is nue :

:t mons mifplaced one; and this is a meater of fate which is 1eil calily cleared and afectained."

His fears concerning the incurabienefs of his ciforder proved too truc. He died on the $25^{\text {th }}$ of Angoult 1,76 ; and was interred in the Caiton buryingground, Edinburgh, where a monument is ctected to his netrury.

HUMECTATION, forried of humour, moilhere, moitening, in plarnacy, the preparing of a medicine, by thecping it a while in water, in order to foften and muillen is when too dry ; or to cleaule it, or prevent its fubtile parts from being difipated in grindiug, or the like.

Humectation is aifo ufed for the application of moillening remedies.
In this ferfe we fay, embrocations, emplaters, unctions, humectations, fomentations, ¿̌.c.

H'MERUS, or Os HomsR, in anatony, the uppermot't bone of the arna, popularly called the Boshleterhone ; extending from the fcapula, or thoulder-blade, to the upper end of the cubius, or elbow. See Axatomy, 1147.

HUMIDITY, that quality in bodies whereby they are capable of wetting other bodies. This difiers very much from fuidity; and feems to be merely a relative thing, depending on the congraity of the component particles of the liquor to the pores of fuch particular bodies as it is capable of adhering to, penetrating a little into, or weting. Thus, for intance, quicktilver is not a moilt thing with regard to our lands or clothes; hut may be callud fo in reference to gold, tin, or tead, to whofe furfaces it will perfeetly adhere, and render then foft and moilt.

HUMILLATL, a emgregation of religious in the church of Rome, etlablifled by fome Milanefe gentlemen on their releafe from prifon, where they had been corfined under the emperor Conrad, or, as others fay, under Frcderick I. in the year t162. Thisis order, which acquired great wealth, and had no lefs than go monatt cries, was abolilhed by pope Pius V. in 1570 , and their houfes given to the Dominicans and Corddiers for their lusury and cruelty.
HUMILIATION, the aet of tumbling, i. e. of abating a perfon's prite, and bringing hini lower in his opinion.

In this fenfe, humiliation flands dilinguihed from mortification: humiliation brings duwn the mind; morticication fulldues the flefh.

HUMILITY, in ethics, is a virtue confifing in the moderate value which a perfon puss upon himfiff, and svery thing relating to him. Or, more particularly, it confills ia not attributing to ourctes any cexcellence or good which we have unt; in not over. rating any thing which we have or do; in tut taking an innouderate delight in one's felf; in not affuming more (f the praife of a qualty or ation than belungs to us; and ia a lowly fenfe and ack nowledginent of our imperfections, errors, and ins. This virtue expreffes itfelf in the modefly of our appearance, of our purfuits, and of our belavisur towards other men. It is dillinguifhed from aftictation, baflifulut $f s$, and meannefs.
humming bird. See Trochalus.
HUMOUR, from the Latin bumor, in its original fignification, Hands for moiture in general; fiom whence it has been ublmined to hgnify the moilture of
animal bodiss, or thofe fluids which cireulate througth itum them.

It is dittinguihed from moilure in genernt in this, that humours properly exprefs the fluids of the body; when, in a vitiated thate, it womld not be improper to fay, that the fluids of fuch a perfon's body were fill of humones.

The only 月uids of the body, which, in their natural and healthtul thate, are cailed barours, ate thole in the eye; we talk of the aqueous humour, the erytalline humour, without meaning any thing that is morbid or difened: yet, when we fay in general, that toch a perfon has got a humour in his eye, we undertand it in the ufual fenfe of a vitiated fluid.

As the temper of the mind is fuppofed to depend up.n the thate of the flaids in the body, mumour has come to be fynonymons with temper and difpolition. A ferfon's humour, hovever, is different from his difPsfition, in this, that humour feems to be the difeafe of a difpolition: it would be proper to fay that perfons of a ferious temper or difpolition of mind, ware fubject to melancholy humonrs; that thofe of a delicate and tender difpotition, were fubject to peevith humours.

Humour may be agrecable or difagreeable: but it is Aill humour ; fomething that is whinfical, capricious, and wut to be depended upon. An ill-natured man may have fits of grod-humour, which feem to come upon him aceidentally, without any regard to the cominon moral caufes of happinets or mifery.

A hit of eheerfulnefs conthitutes the whole of goodhumour; and a man who has many fuch tits, is a good-homoured-man: yet be may not be good-natured; which is a character that fuppofes fomething more contiant, equable, and uniform, than what was requifitce to contlitute good humour.

Ifumour is often made ufe of to exprefs the quality of the imagitation, which bears a confiderable refemblance to wit.

Wit exprelles fomething that is more defigred, concetted, regular, and artificial; humour, fomething that is more wild, loofe, extravagant, and fantattical ; fomething which comes upon a man by fits, which he can neither command nor rettrain, and which is not perfucily confitent with true politcouci. Humonr, it bas been faid, is often more diverting than wit; yet a man of wit is as much above a man of hunourr, as a genleman is ahove a buffoon; a buffoon, however, with offen divert more than a genteman. The duke of Buckingham, however, makes humour to be all in all: wit, aceurding to him, fhould never be nifed, but to add an agreablenets to fome proper and jult fentiment, which, without fome fuch turn, night pafs withous is effect. Sce Wit.
HUMPHREY (Dr Lawrence), a very learned Englif divine in the 10 th century, who, during the peifecution under queen Miary, retired with other Protellant refugees to Zurich. He returned on the acceffion of queen Elizabeth; and was made prefident of Magdalene collese, Oxford, dean of Glouselficr, and then dean of Winchefter. He was a great and general fechelar, an able linguift, and a deep divine ; and publihed, 1. De religinnis confereatiance at refurmzione, deque primati regun. 2. He ratione inturperctandi cuito. res. 3. Ophinates; five de notilitate, gijy/que origine. 4. Sermons, and otlicr wotks. He died in 1590.

## H U N

HUMULUS, the нop: A genuz of the pentandria order, belonging to the dicecia clafs of plants; and in the natural method ranking under the 53 d order, Satride. The mait calyx is pentaphyllows; there is no corolla; the female caly is monophyllons, pateot obliquely, and entire, there is no corolla; but twa tyles; and one feed within the calyx, the latter conlithing of one large leaf. There is only one fpecies, viz. the lupulus, which is fometimes found wild in heelges near houfes and gardens, but probably is not indigenous. 'The thalk is weak and climbing; it crecps up the fupport in a fpiral, afoending always from the right hatid to the left. Thee Aalk and the leaves are rough to the tuuch; the upper leaves are heart fhaped, the lower ones divided into tharce lobes ferrated on the edges, and grow in pairs on long foottalks. The male flowers grow on a difinet plant on branched peduncles; the fimales on peduncles in pairs of the form of a firolius or conc, compofed of large imhricated salyces containing each one or two fecds. For the culture and ufes of heps, fee the articles Hop and Husbandry.

HUNDRED, hundredun, or (ichturia, a part or divifion of a county; which was anciently fo calied from its containing an hundred families, or from its furnifhing an hundred able men for the king's wars. After king Alfred's dividing this kingtom into counties, and giving the govemment of each county to a fherift, thefe counties were divided into hundreds, of which the conllable was the chicf officer. The grants of hundreds were at firf made by the king to particular perfans: but they are not now held by giant or prefeription, their jurifdiction being devolved to the comity-court ; a few of thein only excepted, that have been by privilege annexed to the crown, or granted to fome great fubjects, and fill remain in the wature of a franchife.

Hundred. Coutt. This is only a larger Colrt Ba. ron, being beld for all the inhabitants of a particular hundred intlead of a manor. The free fuitors are here alio the judges, and the fleward the regiter, as in the cafe of a court-baron. It is likewife no court of record; refembling the former in all points, except that in point of territory it is of a greater juriddiction. This is faid by Sir Edward Coke to have been derived ons of the county court for the eafe of the prople, that they might have jullice done them at the ir own doors, withont any charge or lufs of time: but its intitution was probably co-eval with that of hundreds themfelves, which were formerly obferved to have been introduced though not invented by Alfred, ticing dirived from the policy of the ancient Germans. The centeni, we may remember, were the principal inhabitants of a diltrict compofed of differcint villages, criginally in number an Rundred, but afterwards only called by that name; and who probably gave the fame denumination to the diftrict out of which they were chofen. Cefar fpeaks pofitively of the judicial power excreifed in thior hundred-courts and courts-baron. "Principes regionum, atque pagorum," (which we may fairly conftrue, the lords of hundreds and manors) "inter juos jus dicunt, controverfinfoue minuunts," And Tacitus, who bad examined their conttitution flill more attentively, informs us not only of the authority of the lords, but that of the centerit, the bundredors, or jury ; who ware taken out of the common frechuld-
rra, and had themfelves a thare in the deeermination. Hungary. "Etequatur in concilias "t principes, qui jura per pegos - , rico/gle reddant : centeri furgelis, ex plate conites, confiliuat fimul "t cuatoritas, adjona." This hundredcourt was denominated bereda in the Cothic condlitution. But this court, as carfes are equaliy liable to removal from hence as froan the comenon court-baron, and by the fame writs, ard may alto be reviewed by wit of falfe judgment, is therefore fallen into equal difufe with regard to the trial of actions.

HUNGARY, a kingdom of Europe, the greaten part of which was anciently called l'dmonia. It had the name of Hungary from the Iiuns, a Scythain or 'Tatar nation, who fubducd it in the ninth century. 1e lies between the 18 th and 22 d degrees of catt long. and betwixt the 45 th and 49th degrees of north lat. being bounded to the north by the Carpathian mountains, which feparate it from Poland; to the fouth by Servia, and the river Drave, which feparates it from Sclavonia; to the welt by Moravia, Aullria, and Stivia; and to the ealt by Walachia and Tranfylvania. It is about 240 miles in length, and 235 in breadh ; and is divided iato the Upper and Luwer Hungary, the former being that part which lirs towaris the ealt, and the latter that which lies towards the wett.

The northern parts of the kingdom are mocuntainous and barren, but healthy; the fouthern, on the contrary, are level, and exceeding fruitful, but not very healchy. The country aliong the Danube, from Preburg to Belgrade, for tipwards of 200 miles, is one continued plain, and no toll can be mure fertile ; but the air, by rcafon of the many fiwamps and morafles, is not fo wholefome as on the higher and drier grounds. Here are mines of gold, filser, copper, iron, lead, quickfilver, cinnabar, antimeny, yellow orpiment, falphur, vitriol, marcalite, falt native and factitious, faltpetre, magnets, abeftos or Atomeflax, marble of feveral colours, alabater, with diamonds, and all forts of precious thanes. Corn is in fach platy, that it is fold for one lixth of its price in England. Their grapes are large and lukious; and their wines proferrect io any in Europe. They have valt numbers of cattle and horfes, the latcer monly monfe-coloured, with buffaloes, derr, wild. fowl, gane, and fith, and many fpecies of will beafts, particularly chamois, goats, bears, and lyux: Of vegetables, belides vines, and the conumon forts, here are tubacco, fatfron, buck-wheat, millet, niclons, and chefnuts. Hore alfo are excellent warm baths, and fprings of various kincis and qualities. The chicf mountains of Hungary are the Crapack or Carpathian, which is the gencral name for all thufe that feparate this kingdom from Poland, Mo. ravia, Sile fia, and fome part of Aultia. The fides of moll of them are cowered with wood, and thair tops with fnow. The chicf rivers are the Danube, the Dtave, the Save, the Wag or Waag, the Gran, the 'lemes, the Raab, and Theifs, all well flocked with fith. There are feveral lakes among the Carpathian momtains, and fome alfo in the lowlands.

The intabitants are a mixture of the defendants uf the ancient Hurs, Sclavonians, Camani, Germans, Walachians, Greeks, Jews, Turks, and s: wandering prople called Zisdurs, faid tu be of usicentain origin,

Henery but probably the fame as thofe we called gypfics. The Hungarians are faid to be of a fanguine choleric temper, and fonewhat ferce, crucl, proud, and revengeful They have been always reputed good foldiers, being much more inclined to arms, martial exercifes, and hunting, than to arts, Karning, trads, or agriculture. The nobiline afteit arcat pomp and magnificence, and are much addicted to feafting and earonfing. The men in general are Arong and well proportioned. They fhave their beards, but leave whifkers on the upper-lip; wearing fur caps on their heads, a clufe-bodied coat girt with a fafh, with a thort cloak or mantle over all, fo contrived as to be buchald under the arm, and leave the light hand at libents. Their horfe are called bufiars, and their foot Poywhes. The former wear a broad-fword, or foymeter, and carry a hatchet or battle-as. Their horfes are fleet, but not near fo large as the German horfes, and therefore they fland up on their fhort hirraps when they Arike. The heydukes ufually wear fathers in thicir caps, according to the number of ihe enemies they pretend to have killed. Buth horfe and fout are an excellent militia, very good at a purtait, or ravaging and plundering a country, but not cqual io resular troops in a pitched battle. The women, when they go abroad, wear fhort cloaks and a veit.
'There are four languages fpoken in this conntry, viz. the Hungarian, which, like the people, is of Scythin origit, and has little or no affinity with any European tongue; the German, Sclavonian, Wallachian, and Latin. The laft is fpoken, not only by the better fort, butalfo by the common people, though very corrupily. The people called Zigduns have alfo a particular jargon.- Chriblanity was plasted in Hungary in the minth and tenth centuies. In the fix. teentla the reformation made a great progrefs in it ; but at prefent, though the Roman cathotics hardly make a fourth part of the inhabitants, their religion is predominant, the Proteltants enjoying only a bare toleration. Befides feveral fects of Proteftants, here are alfo great numbers of the Greek church and Jews; the laft pay double taxes of all kinds. Befides Jefuits colleges and other convents, there are feveral uaiverlitics for the Roman-catholics. The Lutherans alfo and Calkinits have their gymafiums and fohools, but nader divers reffrictions.

As to the traflic of chis country, it is almof wholly in the hands of the Grecks and Jews. The exports conibit chiefy of wine, horfes, catte, metals, ninerals, faftion, wool, and leather. Hungary, in particular, funitles Aullia, and other countries welt of it. with vaft droves of cattle, as well as vanicty of excellont wines, of which thofe of 'Tockay are reekoned the beit. The principal mannfactures are thofe of copper, brafs, iron, and other liard wates. Greas quantitios of brafs and iron are caposted, wrought and unveronght.

Hungary at fatl, hike mif oher comatriss, was dividulinto many litule puincipalities and tates, which ar leneth were wited under one head, who had the rithe of cuke. The hath of thefe dukes was Gefas who, beconing a profelyte to Clriflianiy, was banized; after which, he rafigned the government to his fon
 N15\%.
as the throre was filled by elcetion, though generally out of the fame family, the difipofal of the crown was difputed between the Turkifh and German emperors fur near 200 years: but after the year 1527, when Ferdinand archduke of Auftria was advanced to the throne, the Aulitians found means to influence the elcetions in fuch a manner, as to keep the crown in their family till 1687, whon it was fictled heredita. rily on their heirs male; and now, in confequence of an act made by the dict at Preflurg in 5723 , in cafe of the failure of heirs-male, it is to defcend to females. The flates of the kingdom confift of the prelates, the barons, the gentry, and the royal towns. To the firft clafs belong two archbihops, about a dozen bifhops, near as many abbots and provofts, with the Pauline and Premonitratenfiau Jcfuits. To the fecond, the lladtholder or palatine, who reprefents the king; the conrt-judge; the ban or viceroy of Dalmatia, Croatia, and Sclavonia ; the ftadtholder of TranSilvania; the great treafurer, the great cup-bearer, the fleward of the houfchold, the malter of the horfe, the lord chamberlain, the captain of the yeomen of the guards, and the grand-marhal of the courts who are Hyled the great barons, together with the inferior bans or counts and barons. To the third clafs belong the gentry, fome of whom have noble manors, and others only the privileges of nobles. To the fourth clafs belong the royal fiee cities, which are not fubject to the counts, but hold immediately of the king. The gentry alfo, who hold of the archbilhops and bihops, have the fame privileges as the Hungarian nobility. The common people are vaffials to the lords, on whole lands they live, whether thefe lands belong to the crown, the clergy, nobility, or gentry.

The ordinary revenue of this kingdom is faid to excted a million Sterling, arifing from the mines, daties on cattle, royal demefnes, falt-works, contributions, cuftoms, \&e. The fortifications and garrifons conItantly maintained on the frontiers againit the Turks, are a great expence to the government. Hungary can eafly bring into the field 100,000 men, regulars and militia; for there are 50,000 in actual pay, and the provinces furnith the other 50,000 when they are wanted.
Hengakr-Water, a ditilled water prepared from the tops or flowers of rofemary; fo denominated from a queen of Hungary, for whofe ufe it was firt made. Sce Pharmacy.

HUNariR, an uneafy fenfation occalioned by long abthences from food when the hody is in a healthy flate.-Sec Abstinemee; Fastino; and Anatomy, 110103.

The following vifeful obfervations upon hunger or famine are extracted from a paper by Dr Percival in the fecond volume of the Mancheter Tianfactions.

In famine, life may be protracted (the Dofor obferves) with lefs pain and mifery, by a moderate allowance of water. For the acrimony and putrefaction of the humours are obviated by fuch dilution, the fmall veffels are kept permeable, and the lungs are furnihed with that moiture which is effintal to the performance of their functions. Fontanus, a writer of refpeCtable authority in the eftimation of Morgagni, relates the hiftory of a woman who obtimatly refufed to take any filtenance, except
twice,

## H U N [ 213 ] H U N

unger. trice, during the fpace of 50 days, at the end of which period the died. But he adds, that the ufed water by way of drink, though in finall quantity. Redi. who made many experiments (crucl and unjuftifiable in my opinion), to afcertain the effects of fating on fowle, oblerved, that none were able to fupport life beyond the ninth day to whom drink was denied; whereas one indalged with water lived more than 20 days.

Hippocrates has olfervel, that children are more affected by abdinence than young perfons; thefe, more than the middle aged; and the middle aged, more than old men. The power to endare famine, hawever, mult de'pend no lefsupon the flate of health and llength than on the age of the fufferer. These are alfo particular conftitutions which do nou fuffer much pain from the calls of hunger. Dr Percival was informed by a young phyfician from Geneva, that when he was alludent at Mintpelier, he falled three nights and four days, with no o. ther refrefhment than a pint of water daily. His hunger was keen, but never painful, during the fir!t and fecond days of lis abtinence; and the two following days, he perceived only a faintnefs when he attempted either"bodily or mental exertion: A fenfe of collmefs was diffufed over his whole frame, but more particutarly affected the extremities. His mind was in a sery unufual fate of pufillanimity; and he experienced a -great tendency to tears whenever be secollected the circumftance which had been the occation of his falt--ing. During the whole period, the alvine excretions were fupprefled, but not thofe hy the kidneys: and at the clofe of it, bis flin became tinged witha thade of yellow. The firlt food he took was veal broth; which had fomething of an intoxicating effect, producing a glow of warmih, and railing his ipirits, fo as to render hin afhamed of his defpondency. Perhaps in the cafe of Sextius Baculus, as recorded in the cominentaries of Cx lar ${ }^{*}$, the extraordinary courage and prowefo which he fuddenly exeried, might be aided by the exhilerating effect of futtenance, which, under fuch circumfances, it is probable he would no longer decline. The fact, houever, evinces, that neither his licknefs nor the fenfations of hunger had been fo violent as much to impair his Arength of borly or vigour of mind. Porpoonius Atticus, the celebrated friend of Cicero, who put a volunaty end to his life in the $7^{7}$ th $y$ year of his age by refufing all food, appears to have experienced eafe from his diforder, rather than any acute fufferings by famine. "Sic cum biduò cibo fe abtinuiffet, fubito febris deceffit, leviorque morbus effe crepit : tamen propofitum nihito fecius perigit. Itaque die quinto, pofquans id conflium inierat, decefit." (Corn. Nepos in Vit. Ponp. Aluic.) From the former circumflance it has been conjectured, that he did not wholly deny limfelf the ufe of water, or of fome other diluent. But though a few examples of this kind may be adduced, we have the evidence of uumerous melancholy facts to flow, that the preflure of want is agoniring to the luman frame. "I have talked, (fays an ingenions writer $\dagger$ ), with the captain of a hip, who was one of fix that endured it in its extremity, and who was the only peifon that had not loft his fenfes when they received accidental relief. He affured me his pains at firt were fo great, as to he often tempted to eat a part of one of the men who died, and which the reft of his crew actually for fome time lised upon: Vor. VIII. Part II.

He faid, that during the continuance of this parosysm, fiunger. he found his pains infupportable, and was defirous at one tine of anticipating that death which he thought inevitable: But his pains, he faid, gradually de creafed after the fixith day ( for they had water in the thip, which kept them alive fo long), and then he was in a Rate rather of languor than defie; nor did he much wih for food, exccpt when he faw others eating; aul that for a while revived his appetite, though with diminithed importunity. The latter part of the time, when his health was almoft deftroyed, a thoufand Arange images rofe tipon his mind; and every one of his fenfes began to bring him wrong information. The moft fragrant perfumes appeared to him to have a ferid fmell; and every thing he looked at took a greenif huc, and fometimes a yellow. When he was prefented with food by the fuip's company that took him and his men up, four of whom died hortly after, he could not help? looking upon it with loathing inftead of defire; and it was not till after four days that his flomach was brought to its natural tone; when the violence of his appectite returned with a fort of canine eagernefs."

To thofe who by their occupations are expofed to fuch dreadful calamitics, it is of ferious importance to be intructed in the means of alleviating them. The American Indians are faid to ufe a compolition of the juice of tobacco, and the thells of fails, cockles, and oytters calcined, whenever they undertake a long journey, and are likely to be dellitute of provifions. It is probable the thells are not burnt into quicklime, hut only fo as to deltroy their teriacity, and to render them fit forlevigation. The mafs is datied, and formed into pills, of a proper fize to be held between the gum and hip, which, being gradually difiolved and fwallowed, obtind the fenfations both of hunger and of thirlt. Tobacco, by its natcotic quality, feems well adapted to counteract the uneafy impreftoos which the gatric juice makes on the nerves of the fomach when it is empty; and the combination of teftaceous powders with it may tend to correct the fecretion that is fuppoled to be the chicf agent in digettion, and which, if not acid, is always united with acidity. Certain at leaft it is, that their operation is both grateful and falutary; for we find the luxurious inhabitants of the Ean Indics mix them with the betel nut, to the chewing of which they ate miverfally and immoderately addicted. Pethaps fuch abforbents may be uffully applied, both to divide the dofes and to moderate the virulence of the tobacco. For, in the iuternal exhibition of this plant, much caution is required, as it prodaces ficknefs, verigo, cold clammy fweats, and a train of other formidable fymptoms, when taken in too large a quantity. During the time of war, the imprefled failors frequemty bring on thefe maladies, that they may be admitted into the hefpitals, and releafed from fervitude. It would be an ealy and fafe experiment to afcertain the efficacy, and to adjult the insredients, of the Indian compolition mentioned. And there is reafon to believe, that the trial would be in fome degrce fuccefsful; for it is known that fnoking tobacco gives relief in thofe habitual pains of the ftomach which appear to arife from the itritation of the gaffric fecretions. The like effe $\mathfrak{A}$ is fumetimes produced by incrcafing the flow of faliva, and fwallowng what is thus difcharged. And Dr Percival bas related

## Ifunger.

the caft of a gentleman, who ufed to mafticate, many homers daly, a piece of lead, which being neither hard, friable, nor offentive to the palate, fuited his parpore, as he thonght, botter than any other fubthance. He continued the cuttom many years, deriring great eafe from it, and fuffering no fenfible inju$r y$ from the poifonous quali $y$ of the metal. On mentioning this fact to a navy furgeon, the Doctor was told, that the failors, when is hot climates, are wont to mitigate thirit by rolling a bullet in their mouths. A more innocent mean, the Dutor oblerves, might be denfed; but the effucacy of this evinces, that the falivary glands are for a white capable of furnithing a fubAitute for drink. When a fearcity of water occurs at fea, Dr Franklin has advifed, that the mariners fhould bathe themelves in tubs of falt-water: For, in pur. fuing the amufenent of fwimming, he obferved, that, however thintly he was before immerfion, he never contimed fo alterwards; and that, thourh he foaked himfelf feveral hours in the day, and feveral days fuccefively in falt-water, he pereived not, in confequence "f it, the leal talle of faltnefs in his mouth. He alfo further hugrefts, that the fame good effect might perhaps be derived from dipping the failor's apparel in the fea; and exprefles a confidence that no danger of eatching celif would enfue.

To prevent the calanity of famine at fea, it has been propofed by Dr lind, that the powder of falep thould conititute part of the provifions of every thip's company. This powder and portable foup, diffolved in boiling water, form a tich thick jully ; and an ounce of each of thefe articles furnihhes one day's fubfitence to a healihy full grown man. Inderd, from Dr Percival's experiments it appears, that falep contains more nutritious matter, in proportion to its bulk, than any other vegetable production now uled as food. It has the property alfo of concealing the naufeous tate of falt water; and confequently may be of great advantage at fea, when the ftock of freth water is fo far confumed, that the mariners are put upon fhort allowance. By the fame mucilaginous quality, it covers the ofenfivenefs, and even, in fome meafure, corrects the acrimony of Eltid and juirefcent meais. But, as a prefervacive againt hunger, falep would be $m$ ft fficacirus combined with an equal weight of beff fuec. By fwallowing little balls of this lubricating compound at proper intervals, the conts of the flomach woudd be defemded from iritation: and as oils and mucilages are himbly nutritive, of now digeltion, and indifpofed to bato uff be perfication, they are peculiarly wed adapred to hipport life in fmall quantitios. This compoit. tion is fuperior in fimplicity, and perhaps equal in effacacy, to the fullowing one, formath extulled by Aviecom the celebrated arabian phyfician; to whom we are indebted for the introduction of a lubarb, caflia, tamarinds, and fenna, into the materia methoa. "T'ake fwect almonds and beef fuct, of each one pound; of the of of violetstwo ounces; and of the roots of marfla sialiows one ounce: bray thefe ingredients theether in a mortar, and fom the mafo into bolules, abont the lize 4, f a common nut." A wimal fat is dingularly powerful in aftararing the moflache fenfations of thirit, as apfeats from the natrative of the fufterings $E$ :iperienced hy thofe who were confued in the thack hode at Calcurta. of humbed and forty-fix perfors, exhathed by fatigue
and military duty, were there thruft together into a chamber of 18 cubic feet, having only two windows, ftrongly barred with iron, from which, in a clofe fultry night, and in fuch a climate as that of Bengal, litele or no circulation of freth air could be enjoyed. In a few minutes, thefe unhappy wretcles fell into fo profufe a perfpiration, that an idea can hardly be formed of it; and this was fuceceded by a raging thirt, which increaled in proportion as the body was drained of its moilture. Water! Water! became the univerfal ciy; and an old foldier on the outhie, through pity, furnifhed them with a few fkinfuls of it. Lut thefe feanty fupplies, like fprinklings on the fire, ferved only to feed and increafe the flame. From this experience of its effects, Mr Holwell, their chief, determined to drink no more; and kept his mouth moilt by fucking the perfpiration out of his fhirt fleeves, and catching the drops as they fell from his head and face. "You cannot imagine (fays he) how unhappy I was if any of them efeaped me." He came into the prifon withour his coat, the feafon being too hot to bear it : and one of his miferable companions, obferving the expedient he had hit upon of allaying his thirf, robbed lim from time to time of a confiderable part of his ftore. This plunderer, whom he found to be a young gentleman in the fervice of the Eafl India Company, afterwards acknowledged, that he owed his life to the many comfortable drauglits which he derived from him. Before Mr Holwell adopted this mode of relicf, he had attempted, in an ungovernable fit of thintl, to drink his own urine : but it was fo intenfely bitter, that a fecond tafte could not be endured; whereas, he affures us, no Briful water could be more foft and pleafant than his perfpiration. And this, we may prefume, confited chithy of animal fat, mehted by exceflive heat, and exuding from the cellular mernbrane through the pores of the kin.

Perfons who have been accuftomed to animal food, are foon reduced when fupplied only with the farinacea. Several yeas ago, to determine the comparative nutritive powers of different fibftances, an ingenions young phyfician, as Dr I'ereisal informs us, made a variety of experimenes on himelf, to which he unfornately fell a facrifice. He lived a month upon bread and water; and under this regimen of diet he every day diminifhed mueh in his weight. But in $1-8+$, a fludent of phific at Edinburgh confined himfelf for a longer fatce of time to a pint of milk and half a pound of white bread daily : And he aftured our author, that he paffed through the ufual labours of itudy and exercife without feeling any decay of health or lifength, and without any dealible lofs of bulk. The cutancous, urinary and alvine excretions, were very fcanty duing the whol period ; and the difcharge of freces occurd only once in a week. In this cafe the oily and coagulable parts of the milk probably furnithed a larger proportion of alinent, and at the fame time contributed to check the watle by perfpiration and other dilchages; for oleagicous fubtances are retaincd long in the body by their rifcidity. Dr Rutfel, in his matural Eillory of Aleppo, relates, that in thofe feafons when oil abounds, the inlabitants, by indulgence in it, are difpofed to fever, and affected with infarctions of the lungs; maladies which indi, cate both retention and obftruction. Milk has been in a flighter degree; and the free ufe of it has been on this account forbidden to athmatics.

Gum arabic might be a good fubititute for falep in the compofition already recommended; and as it will give fuch firmnefs to the mals, as to require manducation, the falisa, by this means feparated and carried into the flomach, would further contribute to alluage the fenfations both of hunger and of thirth. See Gcim-Arabic. 'This gum, combined with fugar and the whites of egge, has been lately extolled in France, under the name of patigumo, as a remedy for catarrhal defluxions. Dr Percival has feen cakes made of thefe ingredients, and thinks they might very well be applied to the purpole of obviating hunger. They are not perifhable in the hottell climates, may be carried about the perfon with convenience, and though very tongh are pleafant to the talle. In the furmula by which they are made, the proportion of fugar is too large, and that of gim arabic too fmall, if the mafs be intended to atfuage the eravings of appetite. According to our author's information, the receipt is as follows. "'Take of tine fugar four ounces, and of gum arabic one ounce: Levigate them well together; and add half an ounce of rofe water, and of the white of eggs a fufficient quantity."

In our attempts to recover thofe who have fuffered under the calamities of famine, great circumfpection is required. Warmth, cordials, and food, are the means to be employed ; and it is evident that the fe may prove too powerful in their operation, if not adminiflered with caution atd judgment. Fur the body, by long falting, is reduced to a flate of more than infantile debility; the minuter veffets of the brain, and of the other organs, collappe for want of fluids to dittend them; the flomach and intellines fhrink in their capacity; and the heart languidly vibrates, having fearcely fufficient energy to propel the feanty current of blood. Under fuch circumftances, a proper application of heat feems an effential meafure, and may be effected by placing on each fide a healthy man in contact with the patient. Peediluvia or fomentations may alfor be ufed with advantage. The temperature of thefe fhould be lower than that of the buman body, and gradually increafed according to the effects of their Hmpulus. New milk, weak broth, or water gruel, ought to be empluyed both for the one and the other; as nutriment midy be conveyed into the fyttem this way by paffages probably the mott pervious in a flate of tating, if not too long protracted. "A lad at New-market $\dagger$, a few years ago, having been almoll ttarved in order that he might be reduced to a proper weight for riding a match, was weighed at nine o'clock in the morning, and again at ten; and he was found to have gained near thirty ounces in weight in the courfe of an hour, though he had only drank half a glafs of wine in the interval. The wine probably ltimulated the action of the nervous fyftem, and incites naturc, exhaufted by abftinence, to open the abforbent pores of the whole body, in order to fuck in fome nourimment from the air." But no fuch abforption as this can be expected in a ftate of extreme weaknefs and emaciation gradually induced; becaufe the lymphatics mull partake of the general want of tone and energy. And notwithttanding the falutary effects of wine in the cafe of the jockey,
who, it is likely, had been reduced by freating as well Hunger. as by abtinence, fuch a ttimulant might prove dange. rous, and even fatal in other cafes. It appears fafer therefore to advife the exhibition of cordials in very finall dofes, and at firtt conliderably diluted. Stender wine-whey will perhaps belt anfwer this purpofe; and afford, at the fame time, an eafy and pleafane nourithment. When the tomach has been a little Alrengthened, an egg may be mixed with the whey, or admuiltered under fome other agrecable form. The yolk of one was, to Cornaro, fufficient for a meal ; and the narratice of this noble Venctian, in whom a fever was excited by the addition of only two ounces of foud to his daily allowance, thows, that the return to a full diet thould be conducted with great caution, and by very flow gradations.

HUNNS, a fierce and favage nation, who formerly inlabited that part of Satmatia burdering on the Paulus Meotis and the Tanais, the ancient boundary between Europe and Alid. Their country, as defrribed by Procopius, lay north of mount Cancalus, which, extending from the Euxine to the Cafpian Seds, parts Aliatic Sarmatia from Culehis, Iberia, and Albania; lying on the itthnus between the two feas above mentiond. Here they relided, unknown to other nations, and themfelves ignorant of other countries, till the year 376 . At this time, an hind purfued by the hunters, or, according to fome authors, an ox thung by a gad-fy, having paffed the marfh, was followed by fome Hunns to the other fide, where they difcovertd a country much more agreeable than their own. On their return, having acquainted their countrymen with what they had feen, the whole nation paffed the marth, and, falling upon the Alans who dwelt on the banks of the Tanais, almolt extermmated them. They next fell upon the Ollogotis, whom they drove out of their country, and forced to retire to the plains between the Borythenes and the Tanais, now known by the name of Podolea. Then attacking the Viliguths, they obliged them to thelter themfelves in the moll monntainous parts of their comery; till at lall the Guthick nations, fiading it impolfible to withitand fuch an inundation of barbarians, obtained leave from the emperor Valens to fette in Thrace.

The Hunns thus became mallers of all the country between the Tanais and Danube in 376, where they continued quietly till the year 38 , when grat numbers of them were taken into the pay of Theodofins I. but, in the mean time, a party of them, called the Nephthalite or Wbite Hanns, who had continued in Alid, over-ran all Mefopotamia, and even laid liege to Edeffa, where they were repulfed with great flaughter by the Romans. The European Hunns frequently paffed the Danube, committing the greateit ravages in the weftern empire; fometimes they fell upon the eallern provinces, where they put all to fire and fword. They were often defeated and repulfed by the Romans, but the cinpire was now too weak to fubdue or confine them from making excurfions; fo that they cortinued to make daily encroachunents, and became every cay more formidable than before. In 44, the Hunns, under Attila, threatened the wellern empire with tutal deltruction. This monarch, having made himfelf nafter of all the northern countries from the confines of Perlia to the banks of the Rhine, invaded Mixelia,
'Thrace,

## H U N

Thrace, and Illyricum; where he made fuch progrefs, that the emperor, not thinking himfelf fafe in Condantinople, withdrew int., Afia. Astila ther broke into Gaul; where he took and deltroyed feveral cities, baffacting the imhabitants with the greatelt cruelty. At lait he was driven out with great daughter by Aetius the Roman general and Theodonic king of the Goths, and could never afterwards make any great progrefs. About the year 452 or 453 Attila died, and his kingdon was imenediately fplit into a number of finall ones by his numerous children, who waged perpetual war with each other. The Hunns then ceafed to be formidable, and became daily lefs able to cope with the other burbarous nations whom Actila had kept in fubjection. Still, however, their dominion was conlderable; and in the time of Charles the Great they were malters of Tranfylvania, Walachia, Servia, Carniola, Carinthia, and the greater part of Auftria, together with Bofuia, Sclavonia, and that part of Hungary which lies beyond the Danube. In the year 776, while Charles was in Saxony, two princes of the Himns, Caganus and Jugunus, fent ambalfadurs to him, defring his friendfhip and alliance. Charles received them with extraordinary marks of friendhip, and readily complied with their requet. However, they entered, not long after, into an alliance with Taffila duke of Bavaria, who had revolted from Chanks, and raifed great diturbances in Germany. Charles diffembled his refentment till he had entirely reduced Bavaria, when he refolved to revenge himfelf on the Hunns for thofe fuccours they had underhand given to his enemy. Accordingly, he ondered levies to be made throughout his donainions; and having by that means affembled a very numerous army, he divided it into two bodies, one of which he commanded himfelf, and the other he committed to the care of his generals. The two armies entered the country of the Hunns at different places, ravaged their country far and near, burnt their villages, and took all their ftrong holds. This he continued for eight years, till the penple were almolt totally extirpated; nor did the Hunns ever afterwards recover themfelves, or appear as a diflinet nation.

There were two different nations that went by the name of Hunus; the Nepelaalite or White Hunns, and the Sarmatian or Scythian Hunns. The former inhabited a rich country, bordering to the north on Perfia, and at a great diftance from the Sarmatian or Seythian Hunas, with whom they had no intercourfe nor the leaft refemblance either in their perfons or manners. They were a powcfful nation, and often frved againft the Romans in the Perfian armies; but in the reign of the emperor Zeno, being provoked by J'erozes king of Perfa laying claim 10 part of their country, they defeated the Perfians in two pitched battles, flew their king, over-ran all Perlia, and held it in fubjection for the fpace of two years, obliging Cabades, the fon and fucceflor of Perozes, to pay them a yearly tribute. Thefe Hunns, called by the writers of thofe times the rubite Hunns, did not wander, like the others, from place to place; b'ot, contented with their own country, which fupplied them with all neceffaries, they lived under a regular government, fubject to one prince, and felform made inroads, unlefs provoled eithes into the Perfan or Roman territories.

They lived according to their own laws, and deait up. Hungen rightly with one another, as well as with the neighbouring people. Each of their great men ufed to choule 20 or more companions to enjuy with him his wealth, and partake of all his diverfinns: but, upon his deceafe, they were all buried with tam in the fame grave. This cuftom favous of barbarity; but in every other refpect, the Nephthalite were a far more civilized nation than the Seythian Hunns, who, break. ing into the empire, filled moll of the provinces of Europe with blood and flaughter.

The later were, according to Ammianus Marcel. linus, a favage people, exceeding in cruelty the mofebarbarous nations. They begin to practife their cratly, fays Jomandes, upon their own children the very lirit day they come into the world. cutting and mangling the cheeks of their males, to prevent the growth of hair, which they mutt have looked upon, contrary to the fentiments of other nations, as unbecoming and unmanly. They had, perhaps, in this practice another view, which Jornandes Seems to infinuate elfewhere, wiz. to fluike terror into the enemy with their countenances, thus deformed and covered with fcars. They had no other food but roots and raw meat, being quite unacquainted with the ufe of fire, and no houles at all, not even huts; but lived contantly expofed to the air in the woods, and on the mountains, where, from their infancy, they were inured to hunger, thirft, and all manner of hardhips: nay, they had fuch an averfion to houfes, which they called, the fipulchres of the living, that, when they went into other countries, they could hally be prevailed upon: to come within the walls of any houfe, not thinking themfelves fafe when thut up and covered. They ufed even to eat and fleep on holleback, farce ever difmounting; which, in all likelihood, induced Zofimis to write, that the Huns could not walk. They covered their nakednefs with goats kins, or the kins of a fort of mice fewed together. Day and night were indifferent to them, as to huying, felling, eating, and drinking. They had no law, nor any kind of religion; but complied with their incliuations, whatever they prompted thens to, without the leall reftraint, or dillinction betwen good and evil. In war, they be gan the battle with great fury, and an hideous noife: but if they met with a vigorons oppolition, their fury began to abate after the firlt onfet; and when once put into diforder, they never rallied, bur fled in. the utmof confufion. They were quite unacquainted. with the art of befieging towns; and authors obferve. that they never attacked the eneny's carnp. They were a faithlefs nation, and thought themfelves no longer bound by the molt folemn treatics, than they found their advantage in obferving them. Hence we. often find them, upon the leaft profpect of obtaining more advantageous conditions, breaking into the Roman empire, in defiance of the molt folemn oaths and. engagements. Several corps of Hunas, after. theis coming into Europe, ferved in the Roman armies againtt the Goths and other barbarous nations; nay, they were ready, for hire, to light againt each other, being blind to every other regard and confideration.

HUNGERFORD, a town of Berkfhire in Eng. land, feated on the river Kennet, in a low and watery foil. It is a great thoroughfare in the Bath and Bri-
foll road, 65 miles from London; and was formerly called Ingleford- Cbarnan:/lreet. The conilable of this town, who is chofen annually, is lord of the manor, which he holds immediately of the crown. They have a horn here which holds ahout a quart, and appears by an infeription on it to have been given by John of Gaunt, together with a grant of the royal lifhery, in a part of the river which abounds with good trouts and craw- fifh. Here is a marktt on Wednefdays, and fair in Augult.

HUNNINGUEN, a town of Germany, in Alface, and in Surtgaw, finbject to the French; feated on the Rhine, and fortified by Vauban. E.. Long. 11. 40. N. Lat. 47.42.

HUNTER, a name given to a horle qualified to carry a perfon in the chace. The fhape of the horfe defigned for this fervice, fhould be ftrong and well knit toge:ther, as the jockeys exprefs it. Irregular or unequal thapes in thefe creatures are always a token of weaknefs. The incqualities in fhape which thow a horfe improper for the chace, are the laving a large head and a fmall neek, a large leg and a fmall foot, and the like. The head of the hunter fhould indeed always be large, but the neck foould alfo be thick and Arong to fupport it. The head fhould be lean, the noftrils wide, and the windpipe flraight.

The hunter, in order to his behaving well in the field, ought to have great care and indulgence in the ftable: he ought to have as much reft and quiet as may be, to be kept well fupplied with good meat, clean litter, and frefh water by him; he fhould be often dreffed, and fuffered to lleep as much as he pleafes. He thould be fo fed, that his dung may be rather foft than hard, and it mull be of a bright and clean colour. All this may be eafily managed by the continual obfervance and change of his food, as occafion requires. After his ufual feourings he fhould bave exercifes and mathes of fweet malt, or bread and beans; or wheat and beans mixed together, are to be his bell food, and beans and oats his worlt.

Some very great fportfmen are for keeping their borfes out at grafs all the huck-hnating feafon, never taking them up into the flabie at all, but allowing them in the field as much oats with their grafs as they will eat. The horfe may be thus rid three days in the zeek for the whole feafon, and never damaged by it, cor ever fhowing any marks of harm afterwards.

The whole thape of a horfe intended for a hunter, Mould be this: The.ears fhould be fmall, open, and pricked; or though they be fomewhat long, yet if they fland up erect and bold like thofe of a fos, it is a Gign of toughnefs or hardinefs. The forchead fhould be long and broad, not flat; or, as it is ufually tomed, mare-facel, but rining in the middle like that of a hare; the feather fhould be placed ahove the cye, the contrary being thought by fome to threaten blindnefs. The eyes fhonld be full, large, and bright ; the nofrile not only large, but looking red and frefh within; for an open and freth noftril is always elleented a fign of a good wind. The month fhould be large, deep in the wicks, and hairy. The wind-pipe thould be large, and appear fraight when he bricles his head; for if, on the contrary, it bends like a bow on his bridling, it is not formed for a free palfage of the hreath. This defect in a horfe jo exprefitd anonog the dealers by the
phrafe cock throfpled. The head fhould be fo let on to the neek, that a fpace may be felt between the neck and the chise; when there is no fuch fpace, the horfe is faid to be bull-necked; and this is not only a blemith in the beauty of the horfe, but it alfo occafons his wind not to be fo good. The creft hould be fltrong, frm, and well rifen; the neek mould be fraight and firm, not loofe and pliant; the breaft hould be ffrong and broad, the rabs round like a barrel, the fillets large, the buttocks rather oval than broad, the lege clean, flat, and flraight; and, frnally, the mane and tail ought to be loug and thin, not thort and buhy, the latl being comied a mark of dulnefs. When a hunter is this clofen, and has been taught fuch obcdience, that he will readily anfwer to the rider's lignals both of the bricle and hand, the voice, the calf of the leg, and the fpurs; that he knows how to make his way forward, and has gained a true temper of mouth, and a right placing of his inead, and has learned to ftop and to turn readily, if his age be fufficiently advanced, he is ready for the field. It is a rule with all flaunch fportfmen, that no horfe thould be ufed in bunting till he is full five years old ; fome will hunt them at four, but the horfe at this time is not come up to his true flrength and courage, and will not only fail at every tough trial, but will be fubject to Arains and accidents of that kind, much more than if he were to be kept another year firl, when his Arength would be more confirmed.
When the hunter is five years old, he may be put to grafs from the middle of May till Bartholomewtide; for the weather between thefe is fo hot, that it will be very proper to fpare him from work. At bartholomew tide, the flrength of the grafs beginning to be nipped by frolls and cold dews, fo that it is apt to engender crudities in the horfe, he fould be taken up while his coat is yet fmooth and neek and put into the ftable. When he is firf hrought loome, he flould be put in fome fecure and fpacious place, where he may evacuate his body by degrees, and be bronght not all at once to the warm keeping; the next night he may be ftabled up. It is a general rule with many nor to clothe and fable up their horfes till two or three days after they are taken from grafs, and others who put them in the fable afiter the firt night, yet will not drefo and clothe them tiil three or four days afterward; but all this, except the keeping the horfe one day in a large and cool place, is needlefís caution.

There is a general practice among the grooms, in many places, of giving their hunters wheat-Atraw as foon as they take them up from grafs. They fay they do this to take up their bellies; but there feems much reafon to difapprove of this. The change is very violent, and the nature of the flraw fo heating and drying, that there feems great reafon to fear that the altringent nature of it would be prejudicial, more than is at frot perceived. It is always found that the dung is hard after this fool, and is voided with pain and difficulty, which is in general very wrong for this fort of horfe. It is bet er therefore to avoid this thaw. feeding, and to depend upon moderate airing, warn cloathing, and good old lay, and old corn, than to have reccurfe to any thing of this kind.

When the horfe has cractated all his grais, and has been froperly hod, and the floces have hal tine in.
fuonte:. fettle to his feet, he may be ridden abroad, and treated in this manner: the greom ought to vifit him early in the morning, at five o'elock in the long days, and at fix in the fhort ones; lie mutt then clean out the thable, and feel the horfe's neek, flank, and belly, to find the flate of his health. If the flank feels foft and flabby, there is a necefthty of good diet to harden it, otherwife any great exercife will oceafion fwellings and goutienfs in the hecls. After this examination, a handful or two of grood old oats, well ifted, thould be given him; this uill make him have more inclination to water, and will alfo make the water fit better on his thomach, than if he drank falling. After this he is to be tied up and dreffed. If in the doing of this he opens his mouth, as if he would bite, or attempts to Wick at the perfon, it is a proof that the teeth of the curre-comb are too fharp, and mull be filed blunter. it afere this he continues the fame tricks, it is through wantonuefs, and he fhould be corrected for it with the whip. The intent of currying being only to raife the dult, this is to be bruhed off afterwards with a horfe-tail nailed to a handle, or any other light brufh. Then he is to be rubbed down with the brufh, and fufted a fecond time; he fhould then be rubbed over with a wet hand, and all the loofe hairs, and whatever foulnefs there is, floult be picked off. When this is cone, and he is wiped dry as at frit, a large faddlecluth is to be p:t on, reaching dowa to the furring phace; then the faddle is to be put on, and a eluth thrown over it that he may not take cold: then rub down his legs, and pick his feet with an iron picker, and let the mane and tail be combed with a wet manecois b. Lafly, it is a cuftom to fpurt fome beer in his mouth juft before the leading him out of the flable. He thould then be mounted, and walked a mile at leatt to fome ruming water, and there watered; but he muft only be fuffered to take about half his water at one drinking.
It is the cuflom of many to gallop the horfe at a violent rate as loon as he comes out of the water; but this is extremely wrong for many reafons. It endan. gers the breaking a horfe's wind more than any other practice, and often has been the oceafion of burlling very good horfes. It ufes them alfo to the difagictable trick we find in many horfes, of ruming away as foon as ever they come out of the water: and with fome it makes theto averfe to drinking, fo that they will rather endure thinf, and hurt themflues gieatly by it, than bring on the violent exercife which they renembet always follows it. The better way is to walk him a lotte after he is out of the water, then put him to a gentle gallop for a little while, and after this to bring him to the water again. This hould be done three or four times, till he will not drink any more. If there is a lilly place near the watering place, it is always well tor ride up to it; if otherwife, any place is to be chofon where there is free air and fun. That the creature may enjoy the benefit of this, he is not to be galloped, but waiked about in this place an hour, and then taken home to the ftable. The pleafure the horfe himfulf takes in thefe airings when well managed is very cvident; for he will gape, yawn, and thrug up bis body: and in thefe, whenever he would fland thill to ttale, dung, or liften to any noife, he is not to be

H U N
hindered from it, but encoufaged in every thing of this kind.
The advantages of thefe airings are very evident ; they purify the blood, teach the ereature how to make his breathing agree with the reft of the motions of his body, and give him an appetite to his food, which hunters and racers that are kept falled up are otherwife very apt to lofe. On returning fiom airing, the litter of the table thould be fieh, and by Aliring this and whitling, he will be brought to ltale. Then he is to be led to his ftall. and tied up, and again carefully rubbed down; then he fhould be covered with a linen cloth next his body, and a canvas one over that, made to fit him, and reaching down to his legs. This, as the duke of Newealtle oblerves, is a cuftom which we learned of the Turks, who are of all people the moft nice and carcful of their horfes. Over this covering there fhould be put a body-cloth of fix or eight ftraps; this keeps his belly in thape, and does not hurt him. This cloat in 5 will be fufficient while the weather is not very thalp but in fevere feafons, when the hair begins to rife and ftart in the uncovered parts, a woollen cloth is to be addcd, and this will always ptove fully fufficient.

Different horfes, and different feafons, make variety of the degree of cloathing neceffary; but there alway 3 is an obvious rule to point out the neefflary changes. the roughnefs of the coat being a mark of the want of cloathing, and the finoothefs of it a proof that the cloathing is fufficient. Therefure if at any time the hair is found to flart, it is a notice that fome farther eloathing is to be added.

If the horle iweat much in the night, it is a fign that he is over fed and wants exereife; this therefore is eafily remedicd. An hour or more after the horfe is come in from his airing, the groom flould give him a wifp of clean hay, making him eat it out of his hand; after this let the manger be well cleaned ont, and a quartern of vats clean fifted be given him. If he eats up this with an appetite, he thould have more given him : but if he is llow and indifferent about it, he mufl lave no more. The bufinets is to give him enough, but not to cloy him with food.

If the horfe gets fleth too fatt on this home feeding; he is not to be tlinted to prevent it, but only his exereife increafed ; this will take down his flefh, and at the fame time give him flength and wind. After the feeding in the morning is over the ftable is to be thut up, only leaving him a little lay on his litter. He need be no more looked at cill one o'clock and then only rubbed down, and left again to the time of his evening watering, which is four o'clock in the fummer and three in the winter. When he has been watered, he mult be kept out an heur or two, or more if neceffary, and then taken home and rubbed as after the murning watering. Then he is to have a feed of corn at fix oclock, and another at nine at night; and being then clt aned, and his litter put in order, and hay enough left for the mght, he is to be left till morming. This is the direction for one day, and in this mannerhe is to be treated every day for a fortaight; at the end of whels tune has fleth will be fo hardened, his wind C improved, and his mout? fo quickened, and his gallop brought to fo good a ftroke, that he will be
fit to be put to moderate hunting. During the time that he is ufed to hunting, lie muft be ordered on his days of rell exactly as he is directed for the fortnight when he is in preparation; but as his exercife is now greatly increafed, he mult be allowed a mure ilrength. ening food, mixing fome old folit beans at every feeding with his oats.

And if this is not found to be fufficient, the follow. ing bread mult be given: let two pecks of old beans and one peck of wheat be gruend together, and made into an indifferently fine nocal; then knead is into dough with fome warm water and a good quantity of seaft; let it lie a time that it may rife and fwell, which will make the bread the highter; then make it it into loaves of a peek cach, and let it be baked in a how oven, that it may be thoroughly done without being burns; when it is taken out of the oven, it inull be fet botton upwards to cool: when it is one day ohd the cruft is to be ehipped off, and the crumb criven him for food. When this is ready, he thould have fome of it at leaft once in the day; but it is no to be made the only food, bus fome feeds are to be of oats alone, fome of oats and this bread, and fome of oats and beans mixed together. The making a variety in this manner being the beft of all methods of keeping up the appetite, which is often apt to fail.

The day before the horfe is to hunt, he mult have no beans, becaufe they are hard of digeetion, but only fome oats with this bread; or if he will be brought to eat the bread alore, that will be beft of dll. His cvening feed fhould on this day be fomewhat earlier than ufual; and after this he is only to have a wifp of hay out of the groon's hand till he return from hanting.

HUNTER (DrWilliam), a celebrated anatomift and pliffician, was born on the 23 d of May 1718 , at lilloride in the county of Lanerk in Scotland. He was the feventh of ten children of John and Agnes Hunter, who refided on a fmall eflate in that parith called I.ong Col derwood, which had been long in the pofiefluon of his family. His great grandfather by his father'o gise, was a younger fon of Hunter of Hunterfon, chicf of the family of that name. At the age of fouteen lis father fent him to the colleze of Glafgos. In this feminary he faffed five years; and ty lis prudent behaviour and diligence acequired the etterm of the proferfors, and the reputation of being a good foholar. His father had defigned him for the church; but the idea of fubfrribing to articles of faith was for repognane to the liberal mode of thinking the had already adopted, that he felt an infuperable avesfion to his theological purfuits. In this flate of mind he happened to become acquainted with 1)r Culien, the late celebrated profefior at Edinburgh, who was then jull ellablithed in praftice at Hamilen under the pasponage of the duke of Hamilton. 1)r Cullen's conserfation foon determined him to lay afide all thoughts of the chureh, and to devote himfelf to the profeflion of phylic. His father's confent having been previoufly obtained, Mr Hunter in : 537 went to refide with Dr Cullen. In the family of this excellent friead and preceptor he paffed nearly three years; and thefe, as he has been often heard to acknowledge, were the happiel years of his life. It was then agreed, that he fhould go and profecute his medical Atudies at Edinburgh and Lon-

## 719 \} H U IV

don, and afterwards return to fectic at Hamilton in Henter. partuerthip with 1)r Collen. Ite accordingly fet out fur Edinburgh in Nonember 1740; and continued there till the following Ipring, atiending the lectures of the medical profeftors, and amongt orthers thofe of the tate Dr Alcxander Sionro, who many years afterxards, in allution to this circum?ance, flyled himfelf his old mapter.
Mr Hunter arrived in London in the fummer of $17+1$, and touk up his refidence at Mr, afterwards Dr, Surellhe's, who was at that time an aputhecary in Pell Mall. Ile brought with him a letter of rec momendatiou to his countryman Dr Jamer Duughas, from Mr Fouls prister at Glafgow, who lad been uiffut to the Ductur in collecting for him differcut editions of Ho. race. Dt Douglas was then imeent on a great anatomical work on the boges, which he did not live to complete, and was looking out for a young man of abilitics and indultry whom the might enaploy as a dif. fectur. This induced him to pay particular attention to Mr Hunter; and finding him acute and fentible, he delired him to make him another sifit. A feeund converfation confirmed the ductor in the good opiaion lie had furmed of Mr Hunter ; and without any farther hefitation he invited him into his family to affit in lis diffections and to fuperintend the education of his fon.-Mr Hunter having accepted Dr Douglas's invitation, was by his friendly affifance enabled to enter humfelf als a Suagcon's pripil at St George's Liofpital under Mr Janes Wilkie, and as a diffectug pupil under Dr Frank Nichols who at that time taurht anatomy with conliderable reputation. He likewife at. tended a coarfe of lectures on experimental philofophy by De Defagulicis. Of thefe means of improvement lie did nut fail to make a proper ufe. He foon became. expert in diffection, and Dr Dunglas was at the expence of having feveral of his preparations engraved. Bat before many months had clapfed, he had the misfortune to lofethis excelleat friend. - The death of Dr Douglas, however, made no change of the fiemation of our atehor. Ite conatinued to relide with the Dutior's family, and to purfue his titudies with the fame diligense as before.

In 10, he commanicated to the Rogal Society an eflay on the Structure and Difaies of articulating Carvilages. This ingenious paper, on a fubject which till then had not been fufficiently invefligated, affords. a ftriking teRimony of the rapid prognefs he had made in his anatomical inquirics. As the had it in cuntemplation to teach anatomy, his attention was directed primeipally to :his object; and it deferves to be mentioned as an additional mark of his prudence, that lue did not precipitately engage in this attempt, but paffed feveral years in acyuiring facha degree of knowledge and fach a collection of preparations, as might infure him fuccefs. Dr Nichols, to whom lie communicated his feheme, and who declined giving lecthies about that time in favour of the late Dr Lawrence, did not give him much encouragement to profecute it. But at length an opportunity prefented itfelf for the difplay of his abilities as a teacher. A fuciety of nary furgeons had an apartment in Covent: Garden, where they engaged the late MrSamuel Sharpe. to deliver a courfe of lectures on the operations of fat.. gery. Ms Sharge comisued to repat this courfe,
fiunter. till fonding that it interfered too much with his other engagements, he declined the tafk in favour of Mr Hinter; who gave the fociety fo much fatisfaction, that they requelted him to cextend his plan to anatomy, and at fint he had the ufe of their room for his lectures. This lappened in the winter of 1745 . He is faid to have experienced much folicitude when he hegan to fpeak in public: but the applate he met with foon infired him with courage ; and by degrees he becane to fond of teaching, that for many years before his leath he was never happer than when employad in delivering a lecture. The profts of his two firt courfes were conliderable; but by contributing to the wants of diferent friends, he found himfelf at the return of the next feafon obliged to defer his lectures for a fortnight, merely becaure he had not money enough to defray the necelfary expence of edvertifements.

In 17,7 , he was admitted a member of the corporafion of furgeons; and in the fpring of the following year, foon after the clofe of his lectures, he fet out in company with his pupil, Mr James Dougtas, on a tour through Molland to Paris. His ketures fuffered no interruption by this journey, as he returned to England foon enough to prepare for his wituter-courfe, which began about the ufual time.

At firit he practifed both furgery and midwifery ; but to the former of thefe he had always an avertion. His patron, Dr James Douglas, had acquired confiderable reputation in midwifery; and this probably indu. ced Mr Finater to direct his views chietly to the fame line of practice. His being elected one of the furgeon men-midwives, firlt to the Middlefex, and foon afterwards to the Britifh Lying-in Hofpital, afflted in bringing him forward in this branch of his profeffon, in which he was secommended by feveral of the molt eminent furgenns of that time, who refpeeted his anatomical talents and wihed to encourage him. Bui thefe were not the only circumfances that contributed to his fuccefs. He owed much to his abilities, and much to his perfon and manner, which eminently qualified him for the practice of midwifery.

In $: 750$, he feems to have entirely relinquifhed his views in furgery; as in that year he obtained the degree of Doctor of Phyfic from the univerfity of Glafgow, and began to practife as a phyfician. About this time he quitted the family of Mrs Douglas, and went to refide in Jermyn-fteet. In the fummer of 1751 he revifited his native country, for which he always retained a cordial affection. His mother was still living at Long Calderwood, which was now become his property by the death of his brother James. Dr Cullen, for whom he always entertained a fincere regard, was then eftablifhed at Glafgow, and had acquined conflecrable reputation buth as a practitioner and teacher of phyfic; fo that the two friends had the pieafure of being able to congratulate each other on their mutial profperity. During chis vifit he thowed his attachment to his litule paternal inheritance, by giving many inftructions for repairing and improving it, and for purchafug any adjoining lands that might be offered for fale. After this journey to Scetland, to which he devoted only a few wieks, he was never ablent from London, unletis his profetfional engagements, as fometimes happened, requircd his attendance at a ditance from the capital.

Not58.

In 1735, on the refignation of 1) L Layard, one of Hun the phyticians of the Dritith lying-in hofpital, we find the guvernors of that iuflitution voting their "thanks to Dr Hunter for the fervices he had done the hofpital, and for his contimuing in it as one of the phyficians:" fo that he feems to heve been eftablifhed in this oflice without the ufual form of an election. The year following he was admitted a licentiate of the Royal College of Phy ficians. Soon afterwards he was elected a member of the Medical Society; and to the Cbferoutions ond Ingtivies putlifted by that fociety, he at different periods contributed feveral valuable papers.

In 1762, we find him warmly engaged in controserfy, fupporting his caim to different anatomical difcoveries, in a work intitled Medical Commentaries, the Atyle of which is correet and fpirited. As an excufe for the tardinefs with which he brought forth this work, he obferves in his introduction, that it required a good deal of ume, and he had little to fpare; that the fubject was unpleafant, and therefore he was very feldom in the humour to take it up. In this publication he confined himelelf chictly to a difpute with the prefent learned profefior of anatomy at Edisburgh, concening injections of the teilicle, the ducts of the lacrymal gland, the origin and ufe of the lymphatic veffels, and abforption by vins. He likewife defended himfelf againft a reproach thrown upon him by profeflor Nonro fenior, by giving a concife account of a controverfy he was involved in with Mr Pott conceraing the difcovery of the Hernia Congenita. It was not long before Mr Pott took occafion to give the public his account of the difpute; and, in reply, Ur Hunter added a fupplement to his commentaries. No man was ever more tenacious than Dr Hunter of what he conceived to be his anatumical rights. This was particularly evinced in the year 1780 , when his brother communicated to the Royal Society a difcovery he had made 25 years before, relative to the itructure of the placenta, the communication bet ween it and the uterus, and the vafcularity of the fpongy chorin. At the next meeting of the fociety, a letter was read, in which Dr Hunter put in his claim to the difcovery in quellion. This letter was followed by a reply from Mr Join Hunter, and here the difpute ended.

In $7_{7} 62$, when the queen became pregnant, Dr Hunter was confulted: and two years afterwards he had the honour to be appointed phyfician extraordinary to her majetty.
About this time his avocations were fo numerotts, that he became defirous of Ieffening his fatigue; and having noticed the ingenuity and affiduous application of the late Mr William Hewfon, F. R.S. who was then one of his pupils, he engaged him fort as an affillant, and afterwards as a partuer, in his lectures. This connection continued till the year 1770; when fome difputes happened, which terminated in a feparation. Mr Hewfon was fucceeded in the partnerfhip by Mr Cruskfhank, whofr anatomical abilities are defervedly refpected.

In 1767,1 r Hunter was elected a fellow of the Royal Society: and in the year following communicated to that learned body obfervations on the bones, commonly fuppofed to be elephants bones, which have been found acar the river Olio in America. This
mas not the only fuhject of natural hiftory on which our author employed his pen; for in a fublequent volume of the Philofophival Tranfactions, we lind him offering his remarks on fome boncs found in the rock of Gibraltar, and which be proves to have helonged to frome quadruped. In the fame work, likewife, he puhtithed an account of the nyl.ghav, an Indian animal not deferibed before. In igfos, Dr Hunter became a fetlow of the Socity of Autiquaries; and the fame year, at the inftitution of a Royal Acadeny of Arts, he was appointed by his majefty to the effice of profeflor of anatomy. 'I his appointonent opened a new field for his abilities; and he engaged init, as he did in every other purfuit of his life, rith urabating zenl. If now adapted his anatomical knowledge to the ubjects of painting and fculpture, and the novelty and juilnefs of his oblervations proved at once the readinefs and extent of his genius. In January $\mathbf{1 7 8 1}^{17}$, he was manimouny elected to fuceced the late Dr Joln Fothergill as prelident of the Medical Society. As his name and talents were known and refpected in cuery part of Earope, fo the honours conferred on him were not limited to his own countiy. In 1780 , the Royal Mcdical Soeicty at $\mathrm{Pa}_{3}-$ ris eheted himione of their foreign affociates; and in 1782 , he reccived a fimilar matk of diftinction from the Royal Academy of Sciences in that city.

The mofi fplendid of Dr Hunter's medical publications was the Anatomy of the Human Cravid Uterus. The appearance of this work, which had been begun fo early as the year 1751 (at whisch time 10 of the $3+p$ dates it contains were completed), was retard. ed till the year :775, only by the author's defare of fending it inse the world with fewer imperfections. This great work is dedicated to the king. In his preFace to it, we find the author vely candidly acknowledging, that in moll of the difiections he had been afGifted by his brother Mr Johin Hunter, "whofe accusacy (he adds) in anatomical refearches is fo well known, that to omit this opportunity of thanking him for that affitance would be in fome meafure to difregard the future roputation of the work itfelf." He likewife confeftes his obligations to the ingenious artifts who made the drawings and engravings; "but particularly to Mr Strange, not only for having by his hand licured a fort of immortality to two of the plates, but for laving giver his advice and allitance in every pant with a flady and dilinterelted friendhip. An anaromical defoription of the gravid utcrus was a work which Dr LHanter had in contemplation to give the public. Ile had likewie lorg been employed in collecting and arrenging materials for a hithory of the vasious concretions that are formed in the human body. Amonglt Dr Hunter's papers have been found iwo introductory lectures, which are written out \{o faitly, and with fuch accuracy, that he probably intended no farther correction of them before they thould be given to the wordd. In thefe lectures Dr Hunter traces the hillony of amatomy from the carlielt to the prefent times, along with the general pogrefs of feience and the arts. He confuders the great utility of anatomy jn the practice of $p^{\text {,hy }}$ fice and furgery; gives the ancient divifions of the different fubtances compoling the human boty, which for a iong time prevailed in anatomy; points out the mon advantageous mode of culLivating this branch of natural knowledge; and cone

Vol. VIII. Part II.
cludes with explaining the particular plan of his own Hunter. lectures. Detsdes thefe mantifcripar, he has alfoleft $\longrightarrow$ behind him a condiderable number of cafes of diffec. tion: moltly relating to pregrant women.
'The fame ycar in which the Tables of the Cravin! Utenus made their apparance, D) Hanter commani. cated to the Royal Socicty an Efry on the Origin of the Venercal Difafe. In this pafer he attempted to prove, that this draalful malady uas not brought from America to Europe by the crew of Colunsbis, as hat been commonly fuppofed, although it made its firt appearance about that period. After this paper had been read to the Royal Society, Dr Hunter, in a converfation with the late Dr Mufigrave, was convinced that the teftimony on which he placed his chief depen. dence was of lef weight than the had at firft imagined, as many of Martyr's lectcts afford the moft convincisigr proofs of their having been written a confiderable tires after the period of their dates. Ile thercfore ver? properly laid afide his intention of giving his ef. lay to the public. In the year 1977 1) H Hunter joiss ed with Mir Watfon in prefeniang to the Ruyal Socicty a Arort account of the late Dr Maty's illuefs, and of the appearances on diffection; and the year foilowisg he publifled lis Rettections on the section of the Symphyfis Pubis.

We mult now go back a little into the orider of time to defcuibe the origin and progiefs of Dr Hunter's mufenm, without fome account of which the hi. flory of his life would be very incompletc.

When he began to practife midwifery, le was de. firous of acquiring a fortune fufficient to place hion ir. tafy and independent circumlances. liefore many years had clapfer, he found himfelf in pofteftion of a fum adequate to his wilhes in this refpert; and this he fet apart as a refource of which the might avail himfelf whenever age or infirmities fhould oblige him to retire from bulacefs. After he had obtained this cornpetency, as his wealth continutd to accumulate, he formed a laudable defign of engaging in fome feheme of public utility, and at firft had it in contemplation to found an anatomical fehool in this metro. polis. For this purpofe, about the year 1-65, diring the adminidration of Mr Grenville, he prefentcd a memorial to that miniller, in whieh he requefied the grant of a picce of cround in the Mews, fur tle fite of an anatomical theatre. Dr Hunter undertook to expend L. 7000 on the building, and to erdow a profefformip of atatomy in perpetuity. This fcheme did not meet with the reception it deferved. In a converfation on this fubject foon afterwards with the earl of Stielburne, his lordthip exprefted a wifo that the plan might be carried into exceution by fubfeription, and very generonny requelted to have his name fet duwn for a thoufand guineas. Dr Huater's delicacy would not allow him to adopt this propolal. He chofe rather to execute it at his own expence; and accordingly purchafed a fpot of ground in Great Vind-mill-ftrect, where leeverted a fpacions houre, to which lie removed from Jermyn-Aret in 1770 . In this building, befuses a handfome amphitheatre and other corvenient apartments for his lectures and dilections, there was one magnificont room, fited up with great elegance and propricty as a mufeum. Of the magnitede and value of his anatomical collectiwn fome idea

hunter, Hun'ing. +
may be formed, when we confider the great length of years he enuployed in the making of anatomical preparations and in the diffection of morbid bodies, added If the cagernefs with which he procured additions from the collections of Sandy, Ifewfon, Falconer, Blackall, and others, that were at diferent tines offered for fale in this metropolis. His fpecimens of rare difeafes were likewife frequently increafed by prefents from his medical friends and pupils; who, when any thing of this fort aceurred tothom, very jullly thought they could mot difpofe of it more properly than by ylacingr it in Dr Hanter's mufemm. Sipealing of an acquition in this way in one of his pablications, he fays, "I look upon every thing of this kind which is given to me, as a prefent to the public; and confider mykif as thereby called upon to ferve the public with more diligence."

Befure his removal to Windmill-atreet, he had confined his collection chitfly to fecimens of human and comparative anatomy and of difeafes ; but now he extended his views to foffiz, and likewife to the fromotion of polite literature and erudition. In a thort fpace of time he became poffeffed of "the mot magnificent treafure of Greek and Latin books that has been accumulated by any perfon now living tince the days of Mead." A cabinet of ancient inedals contributed likewife much to the richnefs of his mnfeum. A defeription of part of the coins in this collection, thruch by the Greek free cities, has lately been publimed by the Doctor's learned friend Mr Combe. In a claffical dedication of this elegant volume to the queen, Dr Hunter acknowledges his obligations to her majety. In the preface fome accoumt is given of the progrefs of the collection, which has been brought together fince the year 1770, with fingular tafte, and at the expence of upwards of L. 20,000. In 1781, the mufeum received a valuable addition of fhells, corals, and other curious fubjects of uatural hitory, which had been collected by the late worthy Dr Fothergill, who gave directions by his will, that his collection Mould be appraifed after his death, and that Dr Hunter thould have the refufal of it at L. 500 under the valuation. This was accordingly done, and Dr Hunter purchafed it for the fum of L.1200. The fame of this mufeum fpread throughout Europe. Few foreigners diftinguilhed for their rank or learning vilited this metropolis without requefting to fee it. Men of fcience of our own country always had eafy accefs to it.-Confidered in a collective point of view, it is perhaps without a rival.

Dr Hunter, at the head of his profeffion, honoured with the efteem of his fovereign, and in polfeflion of every thing that his reputation and wealth could confer, feemed now to have attained the fummit of his wifhes. But thefe fources of gratification were imbittered by a difpofition to the gout, which haraffed him frequently during the latter part of his life, notwithftanding his very abttemious manner of living. On Saturday the 15 th of March 1783 , after having for feveral days experienced a return of a wandering gout, he complained of great headrach and naufea. In this flate he went to bed, and for leveral days felt more pain than ufual both in his ftomach and limbs. On the Thurfday following lie found himfelf fo much recovered, that he determined to give the introductory lecture to the
oparations of furgery. It was to no purpole that his fiends urged to him the impropriety of fuch an attempt. He was determined to nake the experiment, and accordinerly detivered the lecture: but towards the conclution his frength was fo exhanted that lie fainted a*ay, and was obliged to be carried to bed by two fervants. The following night and day his fymptoms were fuch as indicated danger ; and on Saturday morn. ing Mr Combe, who madc him an early vifit, was alarmed on being told by Dr lluater himfelf that during the night lie had certainly had a paralytic ftruke. As neither lis fpeech nor his pulfe were affected, and he was able to raife himfelf in bed, Mr Combe encouraged him to hope that lie was millaken. But the event proved the Doctor's idea of his complaint to be but too well founded; for from that time till his death, which happened on Sunday the 30 th of March, he voided no urine without the affatance of the catheter, which was occationally introduced by his brother ; and purgative medicines were adminitered repeatedly with. out procuring a paffage by ftoul. Thefe circumftances, and the abfence of pain, feemed to thow, that the in. tellines and urinary bladder had lolt their fenfibility and power of contraction ; and it was reafonable to prefume that a partial palfy had affected the nerves dittributed to thofe parts.

By his will, the ufe of his mufeum, under the direction of truftees, devolves to his nephew Matthew Baillie, B. A. and in cafe of his death to Mr Cruikfhank for the term of thirty years, at the end of which pericd the whole collection is bequeathed to the univerfity of Glafgow. The fum of eight thoufand pounds fterling is left as a fund for the fupport and aug. mentation of the collection.

Dr Hunter was regularly fhaped, but of a flender make, and rather below a middle tlature. His manner of living was extremely timple and frugal, and the quantity of his food was fmall as well as plain. He was an early rifer; and when bufinefs was over, was conftantly engaged in his anatomical purfuits, or in his mufeum. There was fomething very engaging in his manner and addrefs; and he had fuch an appearance of attention to his patients, when he was making his inquiries, as could hardly fail to conciliate their conf. dence and efteem. In confultation with his medical brettren, he delivered his opinions with diffidence and candour. In familar converfation he was cheerful and unaffuming. As a teacher of anatomy he has been long and defervedly celebrated. He was a good orator; and having a clear and accurate conception of what he tanght, the knew how to place in diftinct and intelligible points of view the moft abtrufe fubjects of anatomy and phyfrology. Among othez methods of explaining and illuftrating his doctrines, he ufed frequently to introduce fome appofite ftory or cafe that had occurred to him in his practice; and few men had acquired a more interedling fund of anecdotes of this kind, or related them in a more agreeable man ner.

HUNTING, the exercife or diverfion of purfuing four-footed beafts of game. See the article Game.

Four-footed bealls are liunted in the fields, woods, and thickets, and that both with guns and grchounds.

Bieds, on the contrary, are either hot in the air,
quntirg. or taken with nets and other devices, which exercife is called fowling; or thes are purfued and taken by birds of prey, which is sa!!ed logeving. See the articles Fowling, Hawking, Falconry, Shooting, Bikn-Catching, and Decor.
E. de Launay, profeftor of the French laws, has an exprefs ircatife of hunting. From thofe words of God to Adam, Gen. i. 26, and 2S. and to Noah, Gen. ix. 2, 3. hunting was conlidered as a right devolved or made over to man; and the following ages appear to have been of the fame fentiment. Accord. ingly we find, that among the more civilized nations it made one of their diverfions; and as to the wiljer and more barbarnus, it ferved them with food and necef. faries. The Roman jurifprudence, which was formed on the manners of the firf ages, made a law of it, and eftablifhed it as a maxim, that as the natural right of things which have no mafter helongs to the firt poffeflor, wild bealls, birds, and fifhes, are the property of whomfocver can take them firll.

But the northern nations of barbarians who over ran the Roman empire, bringing with them a thronger talke for the divertion, and the people buing now por. foffed of ather and niore cafy means of fubtitence from the lands and pofteftoms of thofe they had vanquithed, their chiefs and leaders began to appropriate the right of hunting, and, inftead of a natural right, to make it a royal one. 'Thus it continues to this day; the right of bunting, among us, belonging only to the kirg, and thofe who derive it from him.

The bunting ufed by the ancients was much like that now practifed for the rein-decr; which is feldom hunted at firce, or with loounds; but only drawn with a blood-hound, and foreftalled with nets and engines. Thus did they with all bealls; whence a doy is never commended by them for opening before he has difeovered where the beat lies. Hence, they were not in any manner curious as to the mubic of their homens, or the emmpofition of their kennel or pack, ether for deepnefs, londnefs, or fwectacfs of cry, which is a principal poist in the lunting of our days. Their homfimen, inded, were accufomed to fhout and make a ercat noife, as Virgil obferves in the third of his (becrgics: Ingobtom clamore premes ad ritia carwom. Sut that confuhon was waly to bring the deer to the nets laid for him.

The Sicilian way of hunting had fomethimg in it very extravedinary. - "The nubles or gentry heing informed wifle way a herd of Luer palled, gave notice to one anotlicr, and appointed a metting; every one bringing with him a crof-bow or lome bow, and a bundle of Aawes mod with iron, the heads bured, with a curd pafing though them all : thus provided, tley came to the fierd, and, calling thenfelves amme in a large riug, furreunded the dece. - Then, each taking his ftand, mbound his faggot, fet up his ftake, and tied the end of the cord to that of his next nefighour, at the diflance of ten fect from one another.-- - hen takine fathess, died in crimfon, and fallened on a thread, they tied them to the cord: for that with the leaft breath of wind they would whirl round.-

Which donc, the perfons who kept the Rands with. drew, and hief themfelves in the next cosert. Then the chief ranger entering within the line with hound to draw after the herd, roufed the game with their cry; which flying towards the line, were turned off, and, Aill gazing on the thaking and mining feathers, wandered about as if kept in with a real wall ot pale. The ranger till purfued, and calling every perfon by name as lie paffed by their fland, commanded him to fhort: the firlt, third, or fixtl, as he pleafed: and if any of them mifled, or fuggled out another than that aftigned lim, it was counted a grievous difgrace. By fuch means, as they pated by the feveral ftations, the whole lurd was killed by the feveral hands. Pier. Thireylyphic. lib. vii. cap. 6.

Hunting formed the grateft part of the employment of the ancient Germans, and probably of the Drituns alfo, when they were not engaged in war. We: are informed by fome ancient hillorians, that this was the cafe even as late as the thind century with the unconquered Britons who lived beyond Adrian's wall: nay, that they fubfited chienly by the prey they took in this way. The great attaciment how a by all the Celtic nations to hunting, however, proceeded moft probably from its being a kind of apprenticethip to war. 'I'lus their youth acquired that courage, Atrength, fwiftnets, and dexterity in hardling their arms, which nade them fo formidable in time of war to their enemies. Thus alfo they freed the country from many mifchierous animals which abounded in the forells, furnithing themfelves alfo with materials for thofe fealts which feem to have conflituted their createft pleafure. The young chicftains had thus likewife an opportunity of paying court to their miflrefles, by difplaying their bravery and agility, and making them prefents of their grame; nay, foftrong and univerfal was the paffion for hunting among the ancient Britons, that young ladies of the highelt quality and greatell, beauty fpent much of their time in the chace. They employed much the fame weapons in hunting that they did in war, viz. long fpears, javelins, and bows and arrows; haviag alfo great numbers of dogs to affitt them in finding and purfuing their game. Thefe dogs, we are alfo told, were much admired among other nations, on ac. count of their fuifucfs, Itrengh, fiercenefs, and exquifite fenfe of finelling. They were of feseral diflerent kinds, called by different names, and formed a confiderable article of conmerce. They were highly valued by all the Celtic nations, infomuch that fome very conical penalties were infleted upon thofe who were convicied of fealing them (A). From the poems of Oflian alfo it appears, that the Britons were not unacquainted with the art of catching birds with hawks trained for that purpofe; but they feem to lave been abfoluteiy ignorant of the method of catching fith: for there is not a fingle allugon to this ait in all the works of that venerable bard. Their ignorance of this art is both confirmed and accounted for by Dio Niceus, who affures us, that the ancient Britons never talted fifh, though they had innomerable multitudes in their feas, rivers, and lakes. "By the by (fays Dr Henry), we

may
(A) Si quis cancm veltraum aut fogutium vel petrunculum, prafunferit involare, jubemus ut convialus, cofara ampi populo, pofteriora iplius ofculctur.

Husting may uberve that this agrecment between the poems -m Olizan and the Greek hitorian, in a circumftance fo fingular, is at once a prouf of the genuine antiquity of thele poens, and lhat the Greek and Roman writers vere not fo ill informed about the afrairs and manners of the ancient Brituns as fome have imatined"

The Mexicms, whaterer imberility may be impoted to them in other refpeets, were very dexterous in lunting. They wed bows and arrows, darts, ncts, Shares, and a kind of tubes named carlotiune, through which they thot by blowing out little balls at birds. Thofe which the kings and great men made ufe of were curiounly carved and painted, and likewife aderned with gold and filver. Belides the exercife of the chace which private individuals took eillere for amufe. tnent or to pruvide food for themfelves, there were general lunting matches, fometimes appointed by the king; at othere, underaken with a view to provide plenty of victims for facritices. A large wood, genetally that of Zaxatapec, not far ditint from the capital, was pitcled upon as the feene of thefe grand hunting-natches. Here they chofe the place bed adapted for fetting a gieat number of frares and nets. The wood was iniclofed by fome thoufands of hunters, forming a circle of fix, feven, or eight miles, according to the number of animals they intended to take. Fire was then fet to the grals in a great number of places, and a terrible noife made with drums, horns, fhouting, and whilling. The hunters gradually contracted their circle, continuing the noile till the game were inclofed in a very fmall face. They were then killed or taken in fuares, or with the hands of the hunters. Thie number of animals taken or deftroyed on thefe occafions was fo great, that the frit Spanih vicer y of Mexico wald not believe it without making the experiment himfelf. The phace chofen for his humting match was a great plain in the country of the Otomies, lying between the villages of Xilotepec and S. Giuvani del Rio; the ladians being ordered to procced accomding to their ufual cultoms in the times of their pa anifm. The viceroy, attended by a valt recinue of Spaniards, repaired to the place appointed, where accominodations were prepared for them in houles of wood erected for the purpofe. A circle of mone than 15 iniles was formed by 11,000 Otomies, who hated fuch a quantity of game on the plain, that the siceroy was quite aftonifhel, and commanded the greater part of them to be fet at liberty, which was accordingly done. The number retained, however, was thill incredibly great, were it not attefled by a witnefs of the highen credit. On this occafion upwards of 600 decr and wild goats, 100 cajotes, with a furprifing number of hares, rabbits, and other fmaller aninals. The plain Atll retains the Spanih name Cazalero, which fignifies the "place of the chace."

The Mexicans, befides the ufual methods of the chace, had particular contrivances for catching certain animals. Thus, to catch young afles, they made a frall fire in the woods, putting among the burning coals a particular kind of thone named cacalottl" raven or black fone," which burtts with a loud noife when heated. The lire was covered with earth, and a little maize laid around it. The affes quickly affembled with their young, in order to fued upon the maize; but white they were thus cmployed, the alve burlt, and
feared away the old ones by the explofion, while the Huntin young ones, unable to fly, were carried off by the hunters. Serpents were taken even by the hands, feizing thers intrepilly by the neck with one land, and fowing up the ir months with the other. This method is fill pactifed. They howed the greateli dexterity in trecing the fleps of wild bealls, even when an Europeas coald not have difcerned the finalien print of their feet. The Indian method, however, was by obferving fometimes the herbs or leaves broken down by their feet ; fonctimes the drops of blood which fell from them when wounded. It is faid that fome of the American Indians flow fitil greater dextenity in difcovering the tracts of their enemies, which to an European would be altogether imperceptible.

Hiating was a favourite divertion of the great and bloody cenqueror Jeng hiz Khan, if indeed we can apply the word diverfion to a moniler whofe mild was fet upon the deflruction of his own fpecies, and who only endeavoured to make the murder of brutes fubfervient to that of mon , by keeping his foldiers in a kind of walfare with the beafts when they had no humas enemics to contend with. His expeditions were conducted on a plan limilar to that of the Mexicans already mentioned; and were no doubt attended with fill greater fuccefs, as this numerins army could inclofe a much greater fpace than all the Indians whon the Spanifh viceroy could multer. The Eall Indian princes fill fhow the fame inclination to the chace; and Mr Blane, who attended the henting excurfions of Afoph U1 Dowlah vifir of the Mogul empire and nabob of Oude in $1: 85$ and 1,786, gives the following account of the method practifud on ithis occafion.
The time chofen for the hanting party is about the besimning of December: and the diverfon is continued till the heats, which commence about the beginning of March, whige thom to fop. During this time a circuit of between 400 and 600 miles is gencrally made: the hunters bending their courfe towards the ikiris of the northern mountains, where the country is wild and uncultivated. The vilir takes along with bim not only his court and feraghlio, but a great part of the iahabitants of his capital. His immediate attendants may amount to about 2000; but betides the fo he is alfo followed by 500 or $6=0$ horfe, and fevcial battalions of regwar fepoys with their filld pieces. Four or five hundred clephants are alfo carried along with him; of which fome are ufed for riding, others for fighting, and fome for clearing the jungles and forefts of the game. About as many fumpter horfes of the beautiful Perfian and Arabian breeds are carried along with him. A great many wheel carriages drawn by bullocis likewife attend, which are ufed chicfly for the convenience of the women; fometimes alfo he has an Englifh chaife or two, and fometimes a chariot; but all thefe as well as the horfes are merely for fhow, the vifir himedf never uling any other conveyance than an elephant, or fometimes when fatigued or indifpofed a palanquin. The animals ufed in the fport are principally gre-hounds, of which there may be about 300 ; he has alfo about $2: 0$ hawks, and a few trained leopards for hunting deer. There are a great number of markfmen, whofe profeffion it is to thoct deer; with many fowlers, who provide game; as none of the natives of India know how to Roct gane with
fmell
utirg, fmall hot, or to hune with flow hounde. A vaft num ber of matel-locks are carried along with the cumpany with many Englifl picces of vari,us kiteds, 40 or 50 pairs of piltols, buwis and arrows, befides fwords, daggers, and fabres without number. There are alfo nets of vavious kiuds, fome for qual, and others "ery large, for fithing, which are carried along with him upon elephants, aticimed by lifhermen, fo as atways to be ready for throwing into any river wr lake that may be met with. Every articte that can comeribute to lusury or pleature is likewife carried alung with the army. A great many carts arc loadd with the Ganges watct, and even ice is tratsposted for cooling the driuk. The fruts of the feafon and freth vegetables are daily tent to him frum lis gardens by bearers flationed at the dillance of every ten milcs; by which means each artic'e is conveyed day or night at the rate of fuur miles an hour. Befides the animals already mentioned, there are alfo fighting antelopes, buffalues, and rams in great numbers; alfo feveral hunded pigeons, fome fighting cocks, with a vall varity of parrots, nightingalts, \&c.

To complete the magniticence or extravagance of this expecition, there is always a large bazar, or moving tuwn, whicl attends the camp; confillitg of mupkeepers and artificers of all kinds, money-clanger, dancing.woren: fo that, on the molt mudcrate calculation, the whule number of people in his ramp cannot be computed at fewer than 20,000 . The nubub liunfelf, and all the gentemen of lis camp, are provided with double fets of tents and equipage, which are always fent on the day befure to the place to which he intends to go; and this is generally eight or ten miles in whatever direction moft game is expected; fo that by the time he has finimed his fport in the moming, he finds his whole camp ready pitched for his reception.

The nabob, with the attending sentemen, proced in a regular moving court or durbar, and thus they keep converling together and looking out for gane. A great many foxes, hares, jackals, and fometumes deer, are picked up by the dags as they pafs along: the hawls are carried immediately before the elephants, and let lly at whatever game is fprung for thern, which is generally partridges, bultards, quails, and difierent kinds of herons; thefe laft affording excellent fport with the falcons or tharp-winged hawks. Wild boars are formetimes flarted, and either fhot or run down by the dogs and horfemen. Hunting the tyger, however, is looked upon as the principal divertion, and the difcovery of one of thefe animals is aceounted a matter of great joy. The cover in which the tyger is found is commonly long grafs, or reeds of fuch an height as frequensly to reach above the elephants; and it is difficult to find him in fuch a place, as he common! y endeavours cither to fical off, or lies fo clofe to the ground that he cannot be roufed till the eleplants are almolt upon him. He then roars and fkulks away, but is that at as foon as he can be feen; it being geDerally contrived that the nabob thall have the compliment of firing firt. If he be not difabled, the tyger continues to flulk along, followed by the line of elcphants; the nabob and others fhooting at him as often as he can be feen till he falls. The elephants themfelves are very much afraid of this terrible animal, and diforer their apprehenLons by flatehing and roaring
as foon as thes begin to fredl him or hear lum anuwis gencrally attenpting to tirn asay from the place where he is. When the tyger ran be traced to a pasicular fpot, the eleplants are difpored of in a circle round him; in which cafe he will at laft make a defperate attack, fruinging upon the elephant that is neared, and attempting te tear him with his tecth or claws. Some, hut very few, of the eleplants, can be brouglte to at. tack the tyger; and this they do by corling up their thaks under their mondes, and blen atempuing to tofs, or otherwife dethroy !him with ihein tultio, or to cruh him with their feet or kuecs. It is corbidered as youd fport tu kill one tyger in a day; thumgh fumetimes, when a female is mee with her joung unce, two or thrce will be killed.

The uther objects of purfuit in thefe excurfions are wild elepliants, buffaloes, and rhinocerofes. Our authar was prefent at the hunting of a wild eirplant of vall lize and treng:h. An attempt was firt made to take him alive by furrounding him with tame elephants. while he was kept at bay by crackers and other tire-uorks; but he conltantly eluded every effort of this kind. Sumetimes the drivers of the tane elephants got fo near bin, that they larew fruog ropes over hishead, and enceavoured to detain him by falken. ing them around trees; but he conlantly fuaped the ropes like pack-thread, and purfued his way to thic forelt. Some of the ltrongett and mot furiots of the fighting elephants were then brought up to engage him; but he attacked them with fuch fury that they were all obliged to delitt. In lis Itraggle with one of them he bruke one of his tufks. and the bronen piece, which was upwards of two inches in dianteter. of tolid ivory, flew up into the air feveral yards abo:e their lead.. Orders were now given to kill him, as it appeared impoffible to take him alive; but even this was nut accomplifhed without the greatelt dificuly. He twice turned and attacked the party who purtied him; and in one of thefe attacks t?ruck the elephant obliquely on which the prinee rade, threw him upon his fide, but then paffed on withont vfferiag farther injury. At latt be fell dead, after having received as was fuppored upwards of 1000 balls into his body.

Notwithltanding the general pation among molt na. tions for hunting, however, it has by many been decin. ed an exercife inconfllent with the principles of hamanity. The late kiog of Prultia exprelled himfelf on this fubject in the following manner. " The chace is one of the molt fenfual of pleafures, by which the powers of the body are ftrongly exerted, but thofe of the mind remsin unemployed. It is an exercife which makes the limbs ftrong, afrive, and pliable: but leaves the head whthout improvement. It confils in a violent defire in the purfuit, and the indulgence of a crucl pleafore in the death, of the game. 1 am . consinced, that man is more cruel end favase than any bealt of prey: We eaercife the curvinion given us over thefe our fellow-creatures in the molt tymanical manner. If we pretend to any fuperiurity orer the beaf.s, it ought certainly to conlit in realun; but we commonly find that the moft palfonate luvers of the chace renounce this privilege, and converfe only with their dogs, horfes, and ollor irratiomal animals. This renders them wild and unfeling: and it is prohable that they cannot kee ery mertifu! to the bunan focies.

## ii U N

Funtivg $\rightarrow$ Fon a men who can in cold blood torture a poor innocont animal, connot fecl much compafion for the diftrefles of his own fyecies. And, belides can the chace ve a proper cmployment for a thinking mind :"

The arguments ufed by his majelly againt hunting feem indeed to be much confirmed by confidering the variou: nations who have moft addicted themfelves to it. Thefe, as muit be feen from what has already been taid, were all barbarous; and it is renarkable, that Nimot, the firld great humter of whom we have any account, was likewife the firt who oppreded an ien. A.aved his own frecies. As nations advanced in civili. zation, it always became neceffary to reftrain by haw the inclination of the people for bunting. This was donety the wife legillator Solon, let the Athenians thonld neglect the mechanic arts on its account. The Lacedemonians, on the contrary, indulged themfelves in this diverfion without controul; but they were barbations, and moft cruelly opprefled thofe whom they had in their power, as is crident from their treatment of the Helots. The like may be faid of the Egyptians, Perfians, and Scythians; all of whom delighted in war, and opprefled their own fpecies. The Romans, on the ather hand, who were fomewhat more civilized, were lefs addicted to huating. Even they, however, were exceedingly barbarous, and found it neceffary to moke death and fanghter faniliar to their citizens from their infancy. Hence their diverfions of the amphithearer and circus, where the lunting of wild bealls was thown in the rrot magnificent and cruel manner ; not to mention their fill morc cruel fports of gladiators, \&ec.

In two cafes only does it feem poffible to reconcile the practice of homting with humanity; wiz. cither Whan an unceltivated comntry is over run with mowims amimels; or when it is neceffary to kill will animals for frod. In the former cale, the noxious anmals arc litled becaufe they themfetves would do fo if they were allowed to live; but if we kill even a lion or a tyger merely for the pheafure of kiting him, we are unduabtedly chargeable with crueky. In like manner, our moderin fox-hunters expretsly kill foxes, not in order to deftroy the breed of thefe noxious animals, but for the pleafiere of feeing them cxelt all their power and cunming so fare their lives, and then beholdiug them turn in preces after being half dead with fatigue. This rethement in crudey, it feems, is their favourite diverfion; and it is accounted a crime for any perfon to celtroy thefe animals in felf-defence, as appears from the following pallage in Mr Beckford's treatife on huncing. "Belides the digerg of foxes, by which method many young ones are taken and old ones deAthoyed, trays. \&e. are two ofter fatal to them. Farnue: fire their lambs (which, by the bye, fow fuses ever kill), centemen for their came, and old women for thein pusitry, are their in"ectrate enemics. In the comntry where ilive, mot of the gentlenen are fportfmen; and even thofe who are not, fowe every kind of attention to thofe who are. I am forry it is otherwife wih you; and that your uld gouly neighbour flowld deftroy your fores, Inult own concerns me. I krow forre gentlemen, who. when a neighbour had de-- thevel all their foxes, and thereby prevented them from purfuing a favourite amufement, loaded a cart wihlipaaiels, and went all together and detroyed his phat \{ants. I thenk they might have called this very pro.
perty lex taliunis: and it had the defired effect; for as Hunt the gentleman did not think it pradent to fight them all, he took the wifer method, he made peace with them. He gave an order that no more foxes fould be dellroyed, and they never afterwards killed any of his pheafants."

In the firlt volume of the Manchefter Tranfactions we have a differtation upon the diverfions of hanting, fhooting, \&c. as compatible with the principles of humanity. One argument ufed by the author is, that death is no pofitive evil to brutes. "It would perhaps (fays he) be too hafty an affertion to affirm, that death to brutes is no evil. We are not competent to determine whether their exiflence, like our own, may not extend to fome future mode of being, or whether the prefent limited fphere is all in which they are interelled. On fo fpeculative a queltion lithle can be advanced with precifion; nor is it neceflary for the inveltigation of the fubject befure us. If we may be allowed to reafon from what we know, it may be fafely conjectured, that death to brutes is no pofitive evil: we have no reafon to believe they are endowed with forefight; . id therefore, even admitting that with them the pleafures of life exceed its pains and cares, in termisating their exiftence, they only fuffir a privation of pleafure."

On this extraordinary piece of reafoning we may obfenve, that it would hold much more againft the human fpecies than againd the brutes. There are few amongl us willing to allow that the pleafures we enjoy are equivalent to our pains and cares: death therefore mult be to us a relief from pain and mifery, while to the brutes it is a privation of pleafure. Hence, if it be no politive evil for a brute to fuffer death, to a man it muk be a poftive gool: add to which, that a man lives in hope of an endlefo and glorious life, while a brute has no fuch hope; fo that, if to kill a brute, oul our author's princip!s be no cruelty, to kill a man mull be an act of tendernefs and mercy!

Another argument, tho lefs inconclufive, is our author's fuppoling that death from difeafe is much more to be dreaded in a brute than a violent death. Were trutes naturally in as helplefs a thate as man, no doubt their want of fupport from fociety in cafes where they are attacked by ficknefs, would be very deplorable; but it muft le confidered that the parallel betwixt the two fpecies is in this refpect by no means fair. A brute has every where its food at hand, and is noturally capable of relifting the inclemencies of the weather; but man has not only a natural imability to procure food for himflf in the way that the brntes ${ }^{\circ} 0$, bat is, betiles, very tender and incapable of tefiting the incleanncy of the air. Hence, a man unafilted by fociety munt very foon perifh; and, no doubt, it would be much more merciful for people to kill one another at once, than to deprive them of the benetits of fociety, as is too frequently done in various ways needlefs to be mentioned at prefent. A brute, however, has nothing to fear. As long as its thonach can receive food, nature offers an abuadant fupply. One that feeds upon grafs has it always within reach; and a carnivorous one will content itfelf with worms or infects, which, as long as it is sble to crasl it can thill make a mift to provide ; but fo totally liclplels is man v:hen left to himtelf in a thate of weakniefs, that many
ting. barbarous nations have looked upon the killing of their old and infirm people to be an aEt of inercy.

- Equally unhappy is our author in his other arguments, that the quick tranfition from a thase of perfeet health to death mitigates the feverity. The tranfition is not quick. The fporefmen eftimate their diverfion by the length of the chace: and during all that time the creature mult be tonder the ?!rongelt agonies of terror ; and what perfon of humanity is there who mult not feel for an animal in this !ituation? All this is affented to by our author, who fays, "Hard is the heart who does not commiferate the fufferer." Is not this an acknowledgment on his part, that before a perfon can become a thorotigh fortfman, he mutt harden his heart, and atifle thofe amiable fenfations of cempafion, which on all occafions ought to be encouraged towards every creature, unlefs in cafes of neceffity. But in the prefent cafe no neceffity is or can be pretended. If a gentleman choofes to regale himfelf with venifon of any kind, he may breed the animals for the purpofe. We call Domitian cruel, becaufe he took pleafure in catching flies, and flabbing them with a bodkin. A butcher is excluded from litting on a jury on account of his being accuftomed to fights which are deemed inhuman ; but whether it is more inhuman to knock down an ox at once with an ax, or to tear him in pieces with dogs (for they would accomplinh the purpofe if properly trained), muft be left to the foporfmen to determine.

Lafly, the great argument in favour of hunting, that it contributes io the health of the body and exhilaration of the fpirits, feems equally fallacious with the rea. It cannot be proved that hunters are more healthy or long lived than other people. That exercife will contribute to the prefervation of health, as well as to the exhilaration of the mind, is undoubted; but many other kinds of exercife will do this as well as hunting. A man may ride from morning to night, and amufe himfelf with viewing and making remarks on the country througb which he paffes; and furely there is no perfon will fay that this exercife will tend to impair his health or fink his fpirits. A man may amufe and exercife himfelf not only with pleafure, but profit alfo, in many different ways, and yet not accutlom himfelf to behold the death of animals with indifference. It is this that conftitutes the cruelty of hunting ; becaufe we thus wilfully extinguifh in part that priaciple naturally implanted in our nature, which if totally cradicated would fet us not only on a level with the mont ferocious wild beafts, bui perhaps confiderahly below them; and it mult always be remembered, that whatever pleafure terminates in death is crucl, let ws wfe as many palliatives as we pleafe to hide that cruelty from the eyes of others, or even from our own.

The gentlemen and matters of the fport have invented a fet of terms which may be called the buntinglanguage. The principal are thofe which follow:

1. For beatts as they are in company.-They fay, a leerd of harts, and all manner of deer. A ley of roes. A founder of fwine. A rout of wolves. A richefs of martens. A brace or leah of bucks, foxes, or hares. A couple of rabbits or coneys.
2. For their lodging. - A hart is faid to harbour.

A buck lodges. A roe beds. A hare foats or forms. $\underbrace{\text { Huntins }}$ A coney fits. A for kennels. A matten tres.s. An otter zuathes. A badger carths. A boar coabbes.Heuce, to experfs their dillodging, they fay, Unharbour the hart. Roufe the buck. Start the hare. Bult the coney. (Ynkennel the fox. Uutrie the martea. Went the otter. D) ig the badiger. Rear the boar.
3. For their noife at rutting time.-A hart wilth. A buck growens or trouts. A roe bellowes. A hare teats or faps. An otter zulines. A boar freans. A fox larks. A badger /briels. A wolf hoouls. A goat ratles.
4. For their copulation.- A hart or buek goes te rut? A roe goes to tourn. A boar goes to lrim. A hare or coney goes to buck. A sox gocs to clickitting. A wolf goes to match or make. An otter buntetb for his kind.
5. For the footing and treading.-Of a hart, we fay the fut. Of a buck, and all fallow-decr, the sicace. Of all deer, if on the grafs and fcarce vifible, the folling. Of a fox, the frint; and of other the like vermin, the footing. Of an otter, the marks. Of a boar, the track. The hare, when in open field, is faid to fare, when fhe winds about to deceive the hounds, the doulles; when the beats on the hard highway, and her fuoting comes to be perceived, fle fricketh: in fnow, it is called the irace of the hare.
6. The tail of a hart, buck, or other deer, is callad the firgt?. That of a boar, the sureath. Of a fox, the $b_{\text {ruf }} / \mathrm{or}$ or dig; and the tip at the end, the chafe. Uf a wolf, the jitrn. Of a hare and coney, the fout.
7. The ordure or cserement of a hart and all deer, is called ferumets or ferumilhing. Of a bare, cratiles or crotifing. Of a boar, hites. Of a fox, the blliting; and ot other the like vermin, the fissnts. Of an otter, the Spraints.
8. As to the attire of deer, or parts thereof, thofe of a flag, if perfect, are the bur, the fearls, the little knobs on ir, the beam, the gutcors, the antler, the furantler, royal, fir. rayal, and all at top the crochis. Of the buck, the bur. leam, brow-antler, bleck autker, advancer, palm, and pellers. If the croches grow in the form of a man's hand, it is called a palmed bead. Heads bearing not above three or four, and the croches placed aloft, all of one height, are called crozenell bicals. Heads having double croches, are called forked beads, becaufe the croches are planted on the top of the beam like forks.
9. They fay, a liter of cubs, a nel of rabbits, a〔quirrel's dray.
to. The terms ufed in refpect of the dogs, \&ce are as fullow.-Of gre-hounds, two make a brace; of hounds, a couple. Of gre-hounds, three make a leaffo; of hounds, a cumple and balf.-They fay, lit fis a gre-hound; and, cup off a hound. The ftring wherein a gre-hound is led, is called a leag; and that of a hound, a lyome. The gre-hound has his collor, and the hound his couples. We fay a kenscl of hounds, and a pack of beagles.
Huntivg, as practifed among us, is chiefly performed with dogs; of which we have various kinds, accummedated to the various kinds of game, as hounds, gre-Lowrids, Mood-lounds, tirriers, Sc. See Civis? Howne, \&e.

## H I N

under the heads of enerers, driemse, Aver, fats, Eve.

On fome vecations, nets, fpeare, and intirument, for dieging the growd, are alfo requited: nor is the hunt:ar hom to be omitted.

The ufual chafes among us are, the hart, bust, rue, Iare, fos, badyer, and other.-We thatl here give fomething of what relates to each therer : firts premifing an expianation of fume gencral terms and pirafes, more immedinely ufed in the pro.erefs of the fort itfelf; what belongs to the feveral forts of game in particular being referved for the refpective articles.

IVhen the hounds, then, being calt off, and finding the feent of fome game, begin to onen and ery; they are faid to challoyre. When they are too hufy ere the feent be rood, they are faid to boble. When too bufy where the feent is good, to bawl. When they run it endwife orderly, hodding in together merrily, and making it good, they are haid to be in full oy. When they run along without opening at all, it is called running mute.

When ipanicis open in the Ating, or a gre-hound in the courle, they are faid to lafle.

When heagles bark and ery at their prey, they are faid to yarn.

When the dogs hit the feent the contrary way, they are fid to draw anifs.

When they take frefh feent, and quit the former chale for a new one, it is called buming change.

When they lunt the game by the heel or track, they are faid to bint coutnter.

When the chafe goes off, and returns again, traverling the fame ground, it is called bunting the foil.

When the dogs run at a whole hert of deer, inftead of a fingle one, it is called runting riot.

Dogs fet in readinefs where the game is expected to come by, and calt off after the other hounds are palsed, ate called a relay. If they be caft off ere the other dogs be come up, it is called rammhe.

When, finding where the chale las been, they make a proffer to enter, but return, it is called a blemifh.

A leffon on the horn to encourage the hounds, is named a call, or a recheat. 'That blown at the death of a deer, is called the mert. The part belonging to the dogs of any chafe thoy have killed, is the ravord. They fay, take off a deer's dikin jlitip or cafi a hare, fox, and all forts of vermin; which is done by begin. ning at the fnout, and turning the foin over the ears down to the tail.

Huxting is practifed in a different manner, and with different apparatus, according to the nature of the beats which are hunted, a defeription of whom may he fornd under their refpective articles, infra.

With regard to the feafons, that for hatt and buckhunting begins a formight after midfommer, and lalts till Floly-rood day ; that for the hind and doe, berrins on Holy rool day, and hats till Candlemas; that for fox hunting begins at Chriltmas, and holds till Lady. day ; that for roe hurting begins at Michactmas, and ends at Chrithas; harc-huntiog commences at Michaehnas, and lafls till the end of Filorury ; and where the woll and bore are hunted, the fealon for cach begins at Chrihmas, the firlt ending at Lady-day, and the latter at the Puritication.

When the fpostimen have prosided themflues with $\mathrm{N}^{2}+59$
rects, fucars, and a huncing-hom to call the does to. Hunti gether, and likewife with intruments for divging the ground, the following directions will be of ufe to them 1r. the purfuit of each fort of game.

Badger-Hewtho. In domis this, you muft feek the eartha and burrows where he lies, and in a cear moonthine night go and Itop all the burrows, except one or two, and therein place fome facks, faftened with diawing Itrings, which may fhut him in as foon as he ftraineth the bag. Some ufe no more than to fet a boop in the mouth of the fack, and for put it into the bole; and as foon as the badger is in the fack and ftraineth it, the fack 1lippeth of the hoop and follows him to the earth, fo lie lies tumbling therein till he is taken. Thefe facks or bags loeing thus fet, catt off the homads, beating about all the woods, coppices, hedges, and tufts. round about, for the compals of a mile or two ; and what badgers are abroad, being alarmed by the hounds, will foon betake themfelves to their burrows; and, oblerse that he who is placed to watch the facks, muit ftand clufe and upon a clear wind; otherwile the badger will difcover him, and will immediately fly fome other way into his burrow. But if the hounds can encounter him before he can take his fanctuary, he will then ftand at a bay like a boar, and make good fport, gricvoully biting and elawing the dogs, for the manner of their fighting is lying on their backs, ufing both teech and nails; and by blowing up their fkins defend themfelves againft all bites of the doge, and blows of the men upon their nofes. And for the better prefervation of your dogs, it is good to put broad collars about their necks made of grey fkins.

When the badger perceives the terriers to begin to yearn him in his burrow, he will ftop the hole betwist him and the terricre, and if they till continue baying, he will remove his couch into another chamber or part of the burtow, and fo from one to another, barricading the way before them, as they retreat, cintil they can go no further. If you intend to dig the badger out of his burrow, you mutt be provided with the fame tools as for ligging ont a fox; and belides, you hould have a pail of water to refreth the terriers, when they come out of the earch to take breath and cool themfelves. It will alfo be neceffary to put collars of bells about the necks of your terriers, which making a noife may caufe the batigur to bolt out. The tools ufed for digging out of the badger, being tronblefome to be carried on mems backs, may be brought in a cart. In digging, you mult confider the hituation of the ground, by which you may julge where the chicf angies are; for elfe, inttead of advancing the work, you will hinder it. In this order you may beliege them in their holds, or calles; and may break their platforms, parapets, cafemets, and work to them with mines and countervines until you have overcome them.

Having taken a live and lulty badger, if you would make fpurt, carry him home in a fack and turn hin ont in your court-yard, or fome other inclofed place, and there let him be hmied and worried to death by your hounds.

Thete are the following profts and advantages which acerue by killng this numat. Their fleth, blood, and greale, though they ate not good iond, yet are very nifful for phy ficians and apothecantes for oils, ointments, cough of the lungs, for the ttone, fprained finews, colt-aches, \&c. and the Kin being well dreffed, is very warm and good for old people who are troubled with paralytic diftempers.

Boar-Henting. See Boar.
Buck-Hunting. Here the fame hounds and methods are ufed as in running the flag; and, indeed, he that can hunt a hart or flag well, will not hunt a buck ill.
In order to facilitate the chace, the game-keeper commonly felects a fat buck out of the herd, which he fhoots in order to maim him, and then he is run down by the hounds.

As to the method of hunting the buck. The company generally go out very early for the benefit of the morning. Sometimes they have a deer ready lodged; if not, the coverts ase drawn till one is roufed : or fometimes in a park a deer is pitched upon, and forced from the berd, then more hounds are laid on to run the chace. If youn come to be at a faul, the old faunch hounds are only to be relied upon till you recover him again : if he be funk, and the hounds thrutt him up, it is called an imprime, and the company all found a recheat; when he is run down, every one Atrives to get in to prevent his being torn by the hounds, fallow deer feldom or never flanding at bay.

He that firft gets in, cries hou-up, to give notice that he is down, and blows a death. When the company are all come in, they paunch him, and reward the hounds; and generally the chief perfon of quality amonglt them takes foy, that is, cuts his belly open, to fee low fat he is. When this is done, every one has a chop at his neck; and the head being cut off, is thewed to the hounds, to encourage them to run only at male deer, which they fee by the horns, and to teach them to bite only at the head: then the company all flanding in a ring, one blows a fingle death; which being done, all blow a double recheat, and fo conclude the chace with a general halloo of hoo-up, and depart the field to their feveral homes, or to the place of meeting; and the huntfman, or fome other, bath the deer calt crofs the buttocks of his horfe, and fo carries him home.

Fox. Henting makes a very pleafant exercife, and is either above or below ground.
t. Alove ground. To hunt a fox with hounds, you muft draw about groves, thickets, and bufhes near villages. When you find one, it will be neceffary to flop up his earth the night before you defign to hunt, and that about midnight; at which time he is gone out to prey: this may be done by laying two white flicks acrofs in his way, which he will imagine to be fome gin or trap laid for him ; or clfe they may be flopped up with black thorns and earth mixed together.

Mr Beckford is of opinion that for fox-hunting the pack fhould confift of 25 couple. The hour moit favourable for the diverfion is an early one; and he thinks that the hounds thould be at the cover at fun-rifing. The huntfman hould then throw in his bounds as quietly as he can, and lot the two wbippers-in keep wide of him on either hand; fo that a tingle hound may not efcape them; let them be attentive to his halloo, and let the fortimen be ready to encourage or rate as that directs. The fox ought on no account

Vol. VIII. Part II.

729 II U N
to be hallooed tor foon, as in that cafe he would molt certainly turn back again, and fpoil all the fport.Two things our author particularly recommends, viz. the making all the hounds Aeady, and making them all draw. "Many huntimea (fays he) are fond of having them at their horfe's heels; but they never can get fo well or fo foon together as when they fpecad the cover; befides, I have often known, when there have been only a few finders, that they have found their fox gone down the wind, and been heard of no more that day. Much depends upon the firlt finding of your fox ; for I look upon a fox well found to be half killed. I think people are generally in ton great a hurry on this occation. There are but few inftances where Sportimen are not ton noify, and too fond of encouraging their hounds, which feldom do their bufinefs fo well as when little is faid to them. The huntrman ought certainly to begin with his foremolt hounds ; and I thould wifh him to keep as clufe to them as he convenieatly can; nor can any harm arife from it, unlefs he fhould not have common fenfe. No hounds can then hip down the wind and get out of his hearing; he will alfo fee how far they carry the fcent, a neceffary requifite; for without it he never can make a calt with any certainty. - You will find it not lefs neceffary for your huntfman to be active in preffing his hounds forward when the feent is good, than to be prudent in not hurrying them beyund it when it is bad. It is his bufinefs to be ready at all times to lend them that affiftance which they fo frequently need, and which when they are firlt at a faule is then molt critical. A foxhound at that time will exert himfelf moft; he afterwards cools and becomes more indifferent ahout his game. Thofe huntfmen who do not get forward enough to take advantage of this cagernefs and impetuolity, and direct it properly, feldom know enough of hunting to be uf much ufe to them afterwards. Though a huntfman cannot be too fond of hunting, a whipperin eafily may. His bufinefs will feldom allow him to be forward enougt, with the hounds to fee much of the fport. His only thuught therefore thould be to keep the hounds together, and to contribute as much as he can to the killing of the fux: keeping the hounds together is the fureft means to make them lteady. When left to themfelves they feldom refure any blocd they can get ; they become conceited; learn to tic upon the ferit ; and befides this they frequently get a trick of hunting by themfelves, and are feldon good for much afterwards.
" Every country is foun known ; and nine foxes out of ten, with the wind in the fane quattr, will follow the fame track. It is eafy therefore for the whipperin to cut fhort, and catch the hounds again. With a high feent you cannot puth on hounds too much. Screams keep the fox forward, at the fame time that they keep the hounds together, or let in the witlhounds : they alfo caliven the fport; and, if ditcreetly ufed, are always of fervice; but in cover they fhould be given with the greatel! caution. IXalioos fiddom duany hurt when gou are running up the wind, for then none but the tail-hounds can hear yun: when you are running down the wind, you hould hallow no more than may be neceflaty to brine the tail hourds forward; for a hound that knows his bulinefs feldum wants euccuragement when he is upod a foent. - Mont $\pm Y$ fox-

## II U N

Haplity. $\rightarrow$ foos hunters wifh to fee their hounds run in a good gyle. I confefs 1 myfelf am one of thole; I laste to dec a Aring of thena; nor can I bear to fee them ereep where licy can leap. A pack of harriurs, if they have time, may kill a fox, but 1 defy them to kill him in the tyle in whieh he ought to be killed; they muit hant him down. If you intend to tire him out, you matt expect to be tired alfo jourfelf; 1 never with a chace to be lefs than one hour, or to excced two: it is futficientig long if properly followed: it will feldom be longer malefs there be a fatef fomewhere; cither in the day, the humfman, or the hom's.
" Changing from the hated fox to a freflo one is as bad an accideat at can happen to a pack of fox houms, and requires ail the ingennity and obfervation that man is capable of to guard againt it. Condd a fox-hound dillingrifh a hunted fox as the ever-hound does the deer that is bluwn, fox hanting would then the perfect. A humefman thould always liten to his hounds white they are running in cover; he thould be particularly atentive to the headmolt hunds, and he Thouk be contantly oa his guard againlt a kirter ; for if there be two feents, he mult be wong. Generally fpeaking, the bett feent is lealt likely to be that of the hamted fox: and as a fox feldom fuffers hounds to run up to him as long as he is able to prevent it ; fo, nine times out of ten, when foxes are hallooed early in the day, they are all froch foxes. The hounds molt likely to be right are the bard running line hunting ones; or fuch as the huntfinan knows had the lead before there arofe any doubt of changing. With regard to the fox, if he break over an open country, it is no fign that he is hard run; for they foddom at any time will do that unlefs they are a great way before the bounds. Alfo if the run up the wind;-they feldon or never do that when they have been long hanted and grow weak; and when they run their foil, that alfo may direct him. All this requires a good ear and nice obfervation ; and inded in that confits the chief excellence of a huntman.
"When the hound divide and are in two parts, the whipper-in, in lopping, muft attend to the huntiman and wait for ins halloo, before he attempts to Atop either: for want of proper management in this refpect I have known the hounds thopued at buth places, and both foxes lott. If they have many feents, and it is quite uncertain which is the hunted fox, let him ftop thole that are futhell down the wind; as they can hear the others, and will reach them foonelt : in fuch a cafe there will he litule ufe in fopping thofe that are up the wind. When hounds are at a check, let every one be fifut and ftand ttill. Whippers-in are frequently at this time coming on with the tail-hounds. They fhould never halloo to them when the hounds are at fault ; the lealk thing does them harm at fuch a time, but a halloo more than any other. The humitfman, at a check, had beeter let his hounds alone; or content himfelf with holding them forward, without taking them off their nofes.- Should they be at a fault, alter having made their own calt (which the huntiman fhould always firt encorrage them to do ), it is then his bulinefs to affilt them further; but except in fome paticular intances, I never approve of their being call as long as they are inclited to bunt. The forlt calt I bid my hontiman make is generally a regular one, nut choofing to rely entircly on has judgment: if that thund not fucced, he is then at liberty to follow his own opinion,
and proced as obfervation or genius may direct. When Hunting fuch a call is made, I like to fee fome mark of good feufe and meaning in it ; whether down the wind, or towards fom: likely cover or trong earth. However, as it is at bel uncertain, I always with to fece a regular call before I fee a knowing one; which, as a laft refource, fhould not be called forth till it be wanted: The letting hounds alone is but a megative groolnefs in a huntiman ; whereas it is true this lat fows real genius; and to be perfect, it mult be born with him. There is a fanlt, however, which a knowing huntfman is too apt to commit : he will tind a freh fox, and then clain the merit of having recovered the hunted one. It is always dangerous to throw hounds into a cover to retricue a lod foent; and uniefs they hit him in, is not to be depended on.
" Gentlemen, when hounds are at §akit, are too apt themfelves to prolong ic. They hould always Itop their horfes Come dutance behind the hounds; and if it be pofible to remain filent, this is the time to be fo. They hould be careful not to ride before the hounds or over the feent ; nor fhould they ever meet a hound in the face unlefs with a detign to glop him. Should you at any time be before the hounds, turn your horfe's head the way they are going, get out of their track, and let them pals by yon. In dry weather, and particularly in heathy countries, foxes will run the roads. If gentlemen at fuch times will 1 ide elofe upon the hounds, they may drive them miles without any feent. -High mettled fox-lounds are feldom inchined te fop whilf horfes are clofe at their heels. No one fhould cver ride in a direction which if perfifted in would carry him amongit the hounds, unkefs he be at a great diftance behind them.
" The firt moment that hounds are at fanlt is a critical one for the fport-people, who fhould then be very attentive. Thofe who look forward may perhaps fee the fox; or the running of Theep, or the purfuit of crows, may give them fome tidings of him. Thofe who liften may fometimes take a hint which way he is gone from the chattering of a magpie ; or perhaps be at a certainty from a diftant halloo: nothing that can give any intelligence at fuch a time ought to be neglected. Gentlemen are too apt to ride all together: were they to fpread more, they might fometimes be of fervice; particularly thofe who, from a knowledge of the fport, keep down the wind: it would then be difficult for either hounds or fox to efcape their obfervation. - You fhould, however, be cautious how you go to a halloo. The halloo itfelf mult in a great meafure direct yon; and though it afford no certain rule, yet you may frequently guefs whether it can be deperded upon or nut. At the fowing-time, when hoys are keeping off the birds, you will fometimes be deceived by their halloo; fo that it is belt, when you are in doebt, to fend a whipper-in to know the certainty of the matter."

Hounds ought not to be calt as long as they are able to hunt. It is a common, though not a very jult idea, that a hunted fox never fops; but our anthor informs us that he has known them ftop even in wheelruts in the middle of a down, and get up in the middle of the hounds. The freatetl danger of lofing a fox is at the firt finding him, and when be is linking; at buth which times he frequently will run fhort, and the eagernefs of the hound will fiequently carry them beyond the foent. When a fox is dirtt lound, every one
funting. onght to keep behind the hounds till they are well fettled to the feent; and when the hounds are catching him, our author wifhes them to be as filent as poffible; and likewife to eat him eagerly after he is caught. In fume places they have a method of trecing him ; that is, throwing him acrofs the branch of a tree, and fuffering the hounds to bay at han for fome minutes before he is thrown among them; the intention of which is to make them more eager, and to let in the tailhounds; during this interval alfo they recover their wind, and are apt to eat hin more readily. Our author, however, advifes not to keep him too long, as he fuppoies that the hounds have not any appetite to eat him longer than while they are angry with him.
2. Under ground. In cafe a fox does fo far efcape as to carth, countrymen muft be got together with thovels, fpades, mattocks, pickaxes, \&c. to dig him ont, if they think the earth not too great. They make their earths as near as they can in ground that is hard to dig, as in clay, fony ground, or amongit the roots of trces; and their earths have commonly but one hule, and that is llraight a long way in before you come at their couch. Sometimes eraftily they take poffeflion of a badger's old hurrow, which hath a varicty of chambers, holes, and angles.

Now to facilitate this way of hunting the fox, the buntfinan mull be provided with one or two teriers to put into the earth after him, that is, to fis him into an angle; for the earth often contits of many angles: the wfe of the terrier is to know where he lies; fur as foon as he finds him, he continues baying or barkiug, fo that which way the noife is heard that way dig to him. Your terriers mull be garnilhed with bells hang in collars, to make the fox bolt the fooner ; belides, the collars will be fome fmall defence to the terriers.
'The intlrmoents to dig withat are thefe: a tharppointed fpade, which ferres to begin the trench where the ground is hardekt and broader tools will not fo well enter ; the round hollowed [pade, which is ufeful to dig anong ronts, having very harp edges; the hroad flat fade to dig withal, when the treneh has been pretty well opened, and the ground fofter; mattocks and pickaxes to dig in hard ground, where a fpade will do but litele fervice; the coldrake to cteanle the hole, and to keep it from llopping up; clampt, wherewith yeu may take either fox or badger out alive to make fport with afterwards. And it would be very convenient to have a pail of watce to refreth you terriers with, after they are come out of the earth to take bieath.

Hare-HCNTas: As, of all chafes, the hare makes the greate pallime, fo it gives no little pleatime to fee the craft of this fmall aninal for her felf-prefervation. If it be raing, the hare uftally takes to the ligh-ways; aid if the come to the fide of a young grove, or fpring, the feldom enters, but fquats down till the hounds have over-thot hor ; and then the will return the very way the came, for fear of the wet and dew that hangs an the boughs. In this cale, the huntiman ought to flay an hundred paces before he comes to the wood-dide, by which means he will pereeive whether the return as aforefaid; which if the do, he mult halloo in his hounds; and call them back; and that prefent!), that the hounds may not think it the counter the came firtt.

The next thing that is to be oblereed, is the place
where the hare fits, and upon what wind me makes her form, citber upon the nurth or fouth wind: fhe wall not willingly run into the wind, but run upon afide, or down the wind; but if the form in the water, it is a fign the is foul and mealled: if you hunt fuch a one, have a fpecial regard all the day to the brook. fides; for there, and near plathes, fhe will make all luer croflings, doublings, Ece.

Some hares have been fo crafty, that as foon as they have heard the found of a horn, they woull itdantly fart out of their form, though it was at the diflance of a quarter of a mile, and go and from in fome pool, and retl upun fome rulh-bed in the midll of it ; and would not ltir from thence till they have heard the found of the horn again, and then have farted out again, fivimming to land, and have tlood up before the hounds four hours before they could kill them, fwimming and ufing all fubtilties and crofings in the water. Nay, fuch is the natural craft and fub. tilty of a hare. that fometimes after the has been honted thrie hours, the will flart a freth hare, and fquat in the fame form. Others having been hunted a condiderable time, will creep under the door of a fheep.cot, and hide themfelves anong the fheep; or, when they have been hard hunted, will run in among a Hock of theep, and will by no mears be gotten out from among them till the hounds are coupled up, and the fhecp driven into their pens. Some of them (and that feems fomewhat Itrange) will take the ground like a coney, and that is called gring to the vault. Some hares will go up one lide of the luedge and come down the other, the thickuefs of the hedge being the only dillance between the courfes. A hare that has been forely hanted, has got upon a quickfethedge, and rat a gool way upon the top thereof, and then leapt off upen the ground. And they will frequen! ! betake thenfetres to gure buthes, and will leap from one to the other, whereby the hounds are frequent! in defatit.

Having fonnd where a hare hath selieved in fome palture or corn held, you matt then confider the feafon of the year, and what weather it is: for if it be in the faring-time or fu:aner, a hare will not then fer in bufhes, becanie they are frequen:ly infelled with pifmires, inakes, and adders; but will fet in corn-lields, and open places. Ja the wintertime, they fet near towns and villages, in tufts of thorns and brambles, efpecially when the wind is northerly or foutherly. According to the feafon and nature of the phace where the hare is accultomed to lie, there beat with your hounds, and thart har; which is mush better fort. than trailing of her from her relief to her form.

Aftur the lave has been liarted and is on foot, then Aep in where you faw her pafs, and halloo in your hounds, until they have all undertaken it and go on with it in full cry : then recheat to them with your horn, following fair and foffls at fill, making not too much noife cither with horn or voice; for at the firft, hounds are apt to overhoor the chace through too much heat. But when they have run the fonee of and hom, and you fee the hounds are well in with it, and flick well upon it, then you may come in neater with the hounds, becaule by that time their heat will be couled, and they will hunt more foberly. But above all things, mark the firtt doubling, which mutt be your circction for the whole day; for all the doublings

Hunting. $\underbrace{\text { Hunting }}$

Hunting that he flatl make afterwards will be like the former ; and according to the policies that you hall fee her ufe, and the place where you hunt, you mult make your compaffes great or little, long or thort, to help the de. faults, atuays feeking the moitent and mof commodivens places for the hounds to feent in.

To conclude : Thone who delight in lanting the lare mult rife early, lett they be deprived of the feent of her fuot incps.

Mart or Stag Hex misi. Gefmer, fpeaking of harthumeing, oblerves, that this wild, deceatat, and lubtile beat, frequently deceive it, bunter by windings and monings. Wherefore the prodent hunter mult train his dors with words of art, that he may be able to fet them on and take them off again at pleafure.

Fird of all, he hould encompafs the beaft in her uwn tayer, and fo wharbour her in the vicw of the doge, that fo they may wever lofe her flot or footing. Neither mint he fet upm tvery one, either of the herd or thuef that wander fohtary alone, or a litte one; but partly by dicht, and partly by their footing and fumets, make a judsment or the game, and alfo obferve the largenifis of tis haver.

The huntiman, having nade thefe difeoveries in order to the chace, takes cif the couplings of the dogs; and fome on horfoback, others on foot, follow the cry, with the greaicit art, ohfervation, and fpeed; remembering and interetpting him in his fubtik turnings and headiugs; with all agility leaping hedgres, gates, paks, ditches; neither fearing thorns, down hills, nor woods but musuting freh horle it the fritt tire. Follow the larget head of the whole herd, which muit he lingled ont of the chace; which the dogs perceiving, mut follow; not following any other. Thie dogs are animated to the fport by the winding of horns, and the voices of the humtinen. But fometimes the crafty beall fends forth his litte fquire to be facrificed to the dogs and hunters, inftead of himfalf, lying cloic the mean time. In this cafe, the buntimat mult fund a retreat, break off the dugs, and take the on in, that is, lean them argain, ur til they be brought to the faircr game; which rifeth with fear, yet Rill dtriveth by fight, until he be wearied and breathlefs. The nubles call the bealt a weife bart, who, to avoid all his enemics, runneth into the greatell herds, and fo brings a cloud of trror on the dogs, to obftruct their farther purfuit; fometimes alio bearing fome of the herd into his footings, that fo he may the soore eafily efcape by amufing the dogs. Afterwards he betakes himfelf to his heds again, Alll runming with the wind, not only for the fake of $r$ frelhment, but alfo, becaufe by that means he can the more eafily hear the voice of his punfuers whether they be far form him or near to him. But at lat being again difcoverel by the hunters and fagacions feent of the dogs, he flics into the herds of catte, as cows, theep sce. leaping on a cow or ox, laying the foreparts of his budy thereon, that fo touching the earch only with his hinder feet, he may leave a vety fmall or mo teent at all behind for the hounds to difeern. But their ufual maner is, when they fee themelves hard befet and every way intercepted, to make furce at their enemy with their lorns, who firlt comes upon him, ualef; they be prevented by fpear or fword. When the beal is flain, the luntfman with his born -1, widet the thl ui the buatt ; and then the whole com-
pany comes up, blowing their horas in triumph for fuch a conquett; anong whom, the ikilfullell opens the beall, and rewards the hounds with what properly belongs to them, for their future encouragement; for which purpofe the huntimen dip bread in the kin and bloud of the beall to give to the hounds.

It is very dangerous to go in to a hart at bay; of which there are two forts, one on land and the other in water. Now, if the hart be in a deep water, where you cannot well come at him, then couple up your dojs; for Mosuld they continue long in the water, it would endanger their furbating or foundering. In this cale, get a boat, and fwim to him, with dagger drawn, or elfe with rope that has a noofe, and throw it over his horns: for if the water be fo deep that the hart fwims, there is no danger in appruaching him; otherwife you mult be very cautious.

As to the land bay, if a lart be burnifhed, then you mut confider the place; for if it be in a plain and open place, where there is no wood nor covert, it is dangersus and difficult to come in to him ; but if he be on a hedge-fide, or in a thicket, then, while the hart is flating on the hounds, you may come foftly and covatly behind him, and cut his chroat. If you mifs yous aim, and the hart turn head upon you, then take refuge at fome tree; and when the hatt is at bay, couple up your hands; and when you tee the hart turn head to fly, gallop in roundly to him, and kill him with your fiword.

Direalions at the Deaths of a Hart or Buck. The firlt cerenouy, when the huntiman comes in to the death of a deer, in to cry "ware haunch," that the hounds may not break in to the deer; which being done, the next is the cutting his throat, and there blooding the youngell hounds, that they may the better love a deer, and team to leap at his throat: then the mort having bean blown, and all the company cone in, the beft perfon who hath not taken lay be fore, is to take up the knife that the keeper or huntimm is to iay acrofs the belly of the deer, fome holding by the fore legs. and the keeper or buntiman drawing down the pizele, the perfon who takes lay, is to draw the edge of the knife leifurely along the middle of the belly, beginning naar the brilket, and diawing a litte upon it, enough in the length and depth to difeover how fat the deer is; then he that is to break up the deer, firll flits the flin from the cutting of the throat downwards, making the arber, that fo the ordure may not break furth, and then he paunches him, rewarding the hum Is with it.

In the next place, he is to prefent the fame p.rfon viho took fay, with a drawn hanger, to cut off the head of the deer. Which being done, and the hounds rewarded, the concluding cercinony is, if it be a ttag, to blow a triple mort; and if a buck, a double one; and then all who have lorns, blow a recheat in coneert, and immediately a general whoop, whoop.

Oifer:Hicnting is performed with dogs, and alfo with a tort of inftruments called otter-focars; with which when they find themfelves wounded, they make $t$ land, and light with the dogs, and that moll furioully, as it they were fentible that cold water woull annoy their green wounds.

There is indeed craft to be wfed in hundiay them ; but they may be catched in fuares uada water, and by river-lides: but great care mull be taken, for they
unting. bite forcly and wenomouny; and is they happen to remain lout in the fnare, they will not fail to get themfelves fre by the'r teeth.

In huntiny them, one man mult be on one fide of the river, and anulher on the wher, both beating the banks with dogs; and the beaft not being able to endure the water long, you will foon difeover if there be an otter or not in that quater; for he muft come out to make bis fpraints, and in the night fometimes to feed on grafes and hierlos.

If any of the hownds finds out an otter, then view the eft grounds and moir phaces, to find out which way he bent his head: if you eannot difoner this by the marks, you may partly perceive it by the framis; and then follow the hounds, and lodre him as a hart or decr. But if you do rot find hin quickly. you may imagine he is gone to cousch fomewhere farther off frum the river; for fonretimes they will go to feed a confideratle way from the place of thuit reth, choo. fing rather to go up the river than down it. The perfons that go a-hunting otters, mult carry their fpears, to watch his vents, has being the chief advantage; and if they perceive him fwimming under water, they mut endeavour to tirike him with their fpears, and if they mifs, mult purfue him with the hounds, which, if they be good and perfcetly entered, will go chant. ing and traiting alung by the river-fide, and will beat every root of a tree, and ofier-bed, and tud of bulruthes; nay, they will fometimes take water, and lait the beal, like a \{panicl, by which means le will hardly efcape.

Rye buct Hu:ntion is performed divers ways, and very eafly in the woods.

When chafed, they ufually run againtt the wind, becau'e the coulnefs of the air refrefles them in their courfe; therefore the humefinen place their dogs with the wind: they ufually, when hunted, fref take a large ring, ard afterwards lunt the hounds. They are alfo often taken by counterfecting their voice, which a tikitul huntman knows how to do by means of a leaf in his mouth. When they are hunsed, they turn much and often, and come back upon the dogs directly; and when they can no longer endure, they take fuil, as the hart dots, and will hang by a bough in fuch a manner, that nothing of them fhall appear above the water but their fnout, and they will fuffer the dogs to come juft upon them before they will flir.

The venifun of a roe buck is never out of feafon, being never fat, and therefore they are hunted at any time; only that fome fayour ought to be fhown the Loe white the is lig with fawn, and afterwards till her fawn is able to thife for limfelf; but fome roedoes have been killed with five fawns in their bellies.

He is not called, by the fkilful in the art of huntia, a great roe buck, bue: a fuir roebuch; the herd of them is caliced a bivy: and if he hath nat bevy-greafe upon his tail, when he is broken up, he is rore fit to oe dog's meat than man's meat. The linuuds mult be rewarded with the Lowels, the blood, and feet Rit afunder, and boniled all togetleer ; this is miore propetly called a dofe than a rezuard.

Hosetivg Matche. The firt thing that is to be confidered by one who defigns to match his horfe for his ourn advantage, and his horfe's credit, is not to flatter himalete whith the cpition of his hote, by fancying
that he is a fwift, when he is but a flow gal!opper; Hunnings and that he is a whole-running-boife, that is, that he will run four miles withone a fob at the height of his freed, whe: he is not able to run two or three. Very probably fome gentlemen are led into this error, by their being mitaken in the fpeed of their hounds, who, for want of trying them againt other dags that have heen really fece, have fuppofed their nun to be fo, when in reality they are hut of a middling fpeed; and becaufe their horfe, when trained, was able to follow them all day, and upon any hour, to conmand them upon deep as well as light eartho, have therefore made a falfe conclufion, that their horfe is at fisife as the beft; but, upon trial againft a horfe thit has licen rightly trained after hounds that were tralls feet, have bought their experience perhaps full dear. Therefure it is advifable for all lovers of hunting to procute two or three couple of tried hounds, and once or twice a week to follow after them at train feent; and when be is able to top them on all forts of earth, and to endure heats and colds fourly, then he may better rely on his fpeed and toughnefs.
That horfe which is able to perform a liare chafe of five or fix mites brikly and comageoufly, till his bady be ns it were bathed in fweat; and then. after the hare has been killed, in a nipping frolly morning, ean endere to dland till the fweat be frozen on his bach, fo that he can endure to be picred with the cohd as well as the heat; and then, even in that extemity of cold, to ride another chafe as brikly, and with as muel courage as he did the former; that horfe which ean thus endure heats and colds is mot valued by fportimen. Therefore, in order to make a judginent of the goodnefs of a horfe, observe him after the dea:l of the lirt hare, if the chace has been any thing brik: if, when he is cold, he fluinks up his body, and draws his hegs up together, it is an infallible fign of want of vigour and courage : the like may be dune by the daekcning of his girths after the firlt chace, and from the dulnefs of his teeth, and the duhnefs of his conntenance, all which are true tokens of faintnefs and being tired: and fuch a horfe is not to be relied on in cafe of a wager.

Here it will not be improper to take notice of the way of making matches in furmer times, and the mo. dern way of deciding wagers. The old way of trial was, by runuing fo many train- feents after hounds, as was agreed upoa between the parties concernect, and a beth-courfe, this being found not fo uncertain, but more durable than hate hunting; and the advantage confited in having the trains led on earth moft fuitable to the qualitications of the horfes. But row others choefe to hunt the hare till fuch an hour, and then to sun this widdgoofe chace; a method of raciang that takes its name from the manasr of the dightof wild-geefe, which is generally one after another; fo the two horfes, after running of twelvefore yards, had liberty, which horic foever combld get the leading, to ride what grond he pleafed, the hindmon horfe being beund to follow him, within a cersain diflance agred on by articles, or elfe to be whipped up hy the triers or judges which sode by ; and whiclues horfe could ditance the other wom the matecl.

But this chace, in infelf verg inhuman, was foon found to be very dellrucive to good horfes, ctpecially whan two good thorfes were matched; for nether bing abie

Huneng, to ditance the other till both were ready to fank under their siders through weaknefs, oftentimes the matel was fain to be drawn and left andecided, though both the horfes were quite fpoiled.

This brought up the cullom of train-feents, which afterwards was changed to three heats and a Araight courle ; and that the lovers of horfes might be encouraged to keep grood ones, plates have been erected in many places in Britain. 'The fewer of the before you come to the courle, if your horfe be fiery and mettled, the betier; and the horter the dillance, the better. Alfo, above all things, be fure to make your bargain to have the leading of the firtt train; and then make choice of fuch grounds where your horde may bett thow his [peed, and the fleetelt dogs yon can procure: give your hounds as much law before yon as your triers will allow, and then, making a loofe, try to win the match with a wind; but if you fall in this attempt, then bear your horfe, and fave him for the courfe; but if your horfe be flow, but well-winded, and a true fpurred nag, then the more train feents you run before you come to the ftraight courfe, the better. But here you ought to obferve to gain the lading of the hift train; which in this cafe yon muf lead upon fuch deep earths, that it may not end near any light ground: for this is the rule received among horfenen, that the next train is to begin where the latt ends, and the latt train is to be ended at the flarting place of the courfe; therefore remember to end your lath on deep earths, as well as the firt.

HUN CINGDON, the county-town of Huntingdonflite in England, feated upon an eafy afient, on the north lide of the river Onfe. It was made a free borough by king John, confiling of a mayor, 12 aldermen, burgeffes, \&e. by whom the two members of parliament are chofen. It had anciently 15 parithes, and has now but two ; in one of which, called $5 \%$ Jobn's, Oliver Cromnell was born, in 1599. Here was formerly a calle, built by William the Conqueror, which afterwards belonged to David, a pritsee of Scotland, with the title of earl; but Henry VIII. gave it to George Hallings, with the earldom annexed, in whofe family it Aill continues. It llands in the great north road; and has a bridge built of free-ltone over the Oufe, which is made navigable for fmall vellets as high as Bedford. It is the place where the allizes are kept, and where the county-jail flands. It has a good marketplace, and feveral convenient inns, befides a grammarchool; and is very populous. W. Long. C. 15. N. Lat. 52.23.

Huntingdonshire, a county of England, bounded on the fouth by Bedfordthise; on the welt by Northamptonfhire, as alfo on the north ; and by Cambridgeflire on the ealt ; extending 36 miles in length from worth to fonth, $2+$ in breadth from eatt to weth, and near 67 in circumference. This county, which is in the diocefe of Lincoln, is divided into four hundeds, and contains 6 market towns, 29 vicarages, 78 parilhes, 279 villages, ahout 8220 houfes, and upwards of 41,000 inhabitants; but fends only four nembers to parhiament, namely, two knights of the thire, and two members for Huntingdon. It is a good corn country ; and abounds in paftures, efpecially on the eatlern lide, which is fenny. The relt is diverfified by rifing liills and thady groves, and the river Oufe waters the fouthex: parto

The air of this county is in moft parts pleafant and wholefome, except among the fens and meres, though they are not to bad as the hundreds of Eent and Effex. 'The foil is fruitful, and produces great crops of eorn, and the hilly parts alford a fit patlure for theep. They have great numbers of cattle; and plenty of water-fowl, fifh, and turf for firing ; which lalt is of great fervice to the inhabitants, there being but little wood, though the whole county was a forelt in the time of Henry II. 'The only river belides the Oufe is the Nen, which runs through Whittlefey Mere.

HU.QUANG, a province of the kingdom of C!ina, in Alia, which has a great river called $\overline{1}$ ian , and $T f-$ chinng, which runs acrofs it from eath to welt. It is divided into the north and fouth parts, the former of which contains eight cities of the thit ran's, and 60 of the fecond and third; and the Jatter, feven of the firt rank, and fire of the fecond and third. It is a flat, open country, watered every-where with brooks, lakes, and rivers, in which there are great numbers of tifh. Here is plenty of wild-fowis; the ficlds nourif cattle without number, and the foil produces corn, and various kinds of fruts. 'There is gold found in the fands of the rivers; and in the mines they have iron, tin, Es. In thort, there is fuch a variety of all forts of commodities, that it is called the mazazine of the empire.

IIURA, in hotany: A genus of the monadelphia order, belonging to the monoceia clafs of plants; and in the natural method ranking under the 38 th order, Tricocere. The amentum of the male is imbricated, the perianthiun trancated: there is no corolla; the filaments are cylindrical, peltated on top, and furrounded with numerous or double anthere. The female has neither calyx nor corolla; the fyle is funnel-haped; the fligma cleft in twelve parts; the capfute is twelvecelled, with a fingle feed in each cell. There is bus one fpecies, viz. the crepitans, a native of the Well Indies. lt ifes with a foft ligneous llem to the height of $2+$ feet, dividing into many branches, which abound with a milky juice, and have fars on their bark where the leaves have fallen off. The male flowers come out from between the leaves upon foot-1talks three ituches long; and are formed into a clofe fpikeorcolumn, lying over each other like the feales of fifh. The female fousers are intuated at a diflance from them; and have a long funnel-haped rube fpreading at the top, where it is cut into 12 rellected parts. After the flower, the germen fwells, and becomes a round compreffed ligneous capline, having 12 deep furrows, each being a diflinct cell, containing one large round compreffed feed. When the pols are ripe, they burlh with violence, and throw out their feeds to a contiterable diflance. It is propagated by feeds raifed on a hot-bed; and the plants mult be contantly kept in a flove. The kernels are faid to be purgative, and fometines emetic.

HURDLE, is the name of a fledge ufed to draw traitors to the place of execution.

HURDLES, in fortification, are made of twigs of willows or ofers interwoven chofe together, futained by long flakes. They are nowde in the figure of a long fquare, the length being five or lix feet, and the breadth three and an half. The clofer they are wattled together, the better. They ferve to renler the batteries firm, or to confolidate the paflage over muldy ditches; or to cover traverfes and lodgments for the defence of the workmen againft fire-works or Itones thrown argaint them.

## $\mathrm{H} U \mathrm{R}$

The Romans had a kind of military cexecution for mutincers, called putting to death wider the burdle. The manner of it was this: The criminal was laid at his length in a fhallow water, under an hurdle, upon which was heaped fones, and fo prefled down till he was dromned.

Hurdes, in hufandry, certain frames made either of fplit timber, or of hazle-rods wattled together, to ferve for gates in inclofures, or to make fheepfolds, sc.

HURDS, or Hoens, of nax or hemp; the coarfer parts feparated in the dreflings from the tear, or line fluff. Sce Flaz.

HURL-bone, in a horfe, a bone near the middle of the buttock, very apt to go out of its fockets with a hurt or Arain.

HURLERS, a number of large fones, fet in a kind of fquare figure near Si Clare in Cornwall, fo called from an odd opinion held by the common people, that they are fo many men petrified, or changed into flomes, for profaning the fabbath.day by hurling the ball, an exereife for which the people of that country have been always famous.

The hurlers are oblong, rude, and unhewed. Many anthors fuppore them to have been trophies erected in memory of fome batile; others take them for boundaries to difinguin lands. Laftly, others, with more probability, hold them to have been fepulchral monuments.

HURLY-burly, in vulgar language, denotes confufion or tumult, and is faid to owe its origin to two neighbouring families, Hurleigh and Burlcigh, which filled their part of the kingdom with conteft and violence.

HURON, a valt lake of North-America, fitmated between $84^{\circ}$ and $89^{\circ} \mathrm{W}$. Long. and between $43^{\circ}$ and $4^{\circ}$ of N. Lat. from whence the country contigtous to it is called the country of the Hurons, whofe language is fpoken over a great extent in the fouthern parts of America.

HURRICANE, a general name for any violent florm of wind ; but which is commonly applied to thofe forms which happen in the warmer climates, and which greatly exceed the moll violent forms known in this country. The ruin and defulation acconipanying a hurricane (fays Dr Mofely $\dagger$ ) cannot be defcribed. Like fire, its refillefs force confunts every thing in its track, in the moll terrible and rapid manner. It is generally preceded by are awful itillnefs of the elements, and a clofenefs and mintinefs in the atmofphere, which makes the fun appear red, and the flars larger. But a dreadful reverfe fucceeding-The Rey is fuddenly owercall and wild-The fea rifes at once from a prefuand calm inso mountains-The wind rages and roars like the noife of cannon-The rain defcends in deluges-A
 fuperior regions appear rent with lightning and thun- If If and der-The earth often does and always feens to tremble Haman!. - Terror and conllernation dillract all nature-Birds are carried from the woods into the ocean; and thote whofe clement is the fea, feek for refuge on land-The frightened animals in the field affemble together, and are almoll fuffocated by the impetuofity of the wind in fearching for fhelter; which, when found, ferves then only for detruction-The roofs of houfes are carried to valt di.lances from their walls, which are beat to the ground, hurying their inhabitauts under them-Large trees are toin up by the routs, and lage branches fhivered off, and Iriven through the air in cvery direction, withimmenfe velocity-Every trec and thrub that with. hands the fnock, is llripped of its boughs and foliagePlanes and grafs are laid flat on the earth-Luxuriant ipring is changed in a moment to dreary winter. - This direful tragedy ended, when it happens in a town, the devatlation is furveyed with accumulated horror: the harbour is covered with wrecks of boats and veffels; and the flore has not a veftige of its furncr flate remaining. Mounds of rubbith and rafters in one place, heaps of earth and trunks of trees in another, deep gullies from torrents of water, and the dead and dying bodies of men, women, and children, half butisd, and fcattered about, where Atreets but a few hours before were, prefent the mifcrable furvivors with a fhocking conclution of a feectacle to be followed by famine, and when accompanied by an earthquake, by mortal difeafes.

Thefe deltructive phenomena are now thought to arife from eleatricity; though the manner in whicb it acts in this cafe is ty no means known. It feems probable, indeed, that not only hurricanes, but even the molt gente gales of wind, are produced by the action of the electric fluid; for which fee the articles WMD, Whirlwind, \&c.

HURST, Hyrst, or Herst, are derived from the Saxon byrfl, i. e. a supod, or grove of trees. There are many places in Kent, Suffex, and Hamphaire, which begin and end with this fyllable; and the reafon may be, becaufe the great wood called Am.treforkd extended through thofe countries.

He'ris. Caflle, a forticfs of Hampflire in England, not far from Limington. It is feated on the extreane puint of a neck of land which froots iato the fea, towards the ine of Wight, from which it is ditims two miles.
HUSBAND, a man joined or contraeted with a woman in marriage. see Marriage.

Husbasd- Lanin, a termu ufed in Scotland for a portion of land containing fix acres of fock and feythe land;. that is, of land that may be tilled with a plough, and mowen with a feythe.

## H U S B A N D R $\quad \mathrm{H}$,

THE bufinefs of a farmer, or of one who lives by cultivating the ground. In this view it includes not only agriculture, but feveral other branches connected with it, fiell as the rearing of cattl, the management of the dairy, making bitter and cheefe, raifing flax, timber, \&c. the management of bees, and a num-
ber of other articles which it is difficult to enomerate particularly.

Agriculture, properly fo' called, treats only of the Dirtrenze cultivation of different foils, and prepasing them for tetwixe yielding the largell crop of any kind of vegctable; bat a anticuthos it belongs to hufluandry to make choice of the foil moth bandri.
proper for each different vegetable, and to manage matters fo that each foil may carry what it is bett adapted for, fo that on the whole the produce of the farm may be as advantageons as poffible. In like manner, the hufodndman nuall know what crops are moft proper to be raifed in the country where he lives, either with a view in folk or to provender for cattle. The raaring of thefe, indecd, conititutes one of the molt effential articles of hufbandry; it being requifite that the hufbandman thould know not ouly how to feed them properly, but how to keep them free from difeafes, and to difinguin the belt breeds, fo that fuch as are defigned for work may be capable of doing the molt at leaft expence, and thofe detigned for fale may with the leat trowhle be brought in good condition to market, and afford the greatel profit to himfelf as well as the bett bargain to the purchafer.

It is by means of the hurbandman only that all the iuhabitants of a country are enabled to live; whence it ought to he a confideration with him to cuksate the fround in fuch a manner, as may enable him to afford the froduce at the luweft price. Thus he will alfo confult this cwn intereft for cheapne?s of provitions is the ouly true means by which the population of any conntry can be advanced; and the greater the number of inhatitants, the greater maket will the hufbandman have for his goods. Indeed, by a certain mode of arguing, it may be imagined, that it would be more advantageous to keep up provifions at as high a price as poffible, rather than to lower them: but however this may apply to manufacturs of various kinds, it never (all apply to huibandry; for by raifing the price of provifions, the price of every other thing alfo is raifed, and it becomes more difficult for the herbandman himfelf to live, as well as othets.
Thus the bufinefs of an heffandman is not only ex-
of ficietie. for cnerna ragit g various
b:ancher of hulbuadry tremely complicated ard difficult, but important alfo; infonnch, that focicties have been lately inthtut edin many different parts of the kingdom for its advancement, and premiums offered to thote whe excelled in any particular branch. Some of thefe premiums are held out for railing the greatell quantity of particular kinds of vegetabks; others for gaining the greatell extent of ground from the fea: fome for improving wafte ground; ithers for the invention of the mof ufeful machines for larrowing, fowing, and vations operations in agrichlture. But though the intention of thefe focieties is undonbtedly lautable and patriotic, and though the inremim of maa has in a manner been exhautted to accomplifh the purpofes for which they were inftiuted; it remains yut a matter of great dubbt and uncertainty whether they have really been productive of any public good or not. It does not clearly appear, that the means of fubtimence are rendered more generally eafy, or that the lives of mankind are wore happy and comfortable, than before any focieties were inflituted, or before any confiderable improvemerts in hubandry were made. On the contrary, provifions of all kinds, initead of becoming cheaper, have gradually become dearur, and their pice on the whole is ferfibly augmented every four or five years. Hence it is impofible to andid concluding, that, notuithtanding the ofparcon improvements which have been made in fuck numbers, theic is not yet any tall one in the whole art. - Something of this kind hav been taken notice of even by the N-5!
members of thefe focieties themre.ves; and on this fub. Batb $P$. jeCA Mr Wimpey expreffes himfelf as follows:
"It is certainly clear from the average prices of corn ${ }^{p}$ and provifions of all kinds for 20 years palt, that there is not too much land in cultivation. Prices have advanced confiderably above what has been deemell, and that jully too, the mecium Itandard. As a manufacturing and commercial country, it is properly the duty of legiflature to provide, as far as may be confiltently with the liberty of the fubjeet, that the price of provifions may be kept as near as poffibie to their medium value. This is conceived to be very practicable, even fo as to be a convenience to the grower as well as the confumer. Some writers (Locke, Montefquieu, \&c.) lave fuppofed, that the advance of commodities in price is rather apparent and nominal than real. Things are not fo much, if at all (fay they), advanced in price, as it is imagined. The precious metals are exceedingly increafed in quantity, and proportionably fallen in value. Puffibly there may be fome truth in this obferwation, if we go back fome hundreds of years; and if takeu upon a feale that comprehends all Europe: but from the term of 40 or 50 years, or even from the time that Mr Locke wrote to the prefent hour, there is little difference in the value of gold and filver; an ounce of either being of much the fame value now as then. The frequent and fuaden changes that take place in the price of corn and other commodities, which are fometimes at double the price one gear they were the foregoing, mult be owing to fome other caufe than that above-mentioned, which operaics flowly, if at all, and is not perceptible in lefs than a century.
"If the quantity of corn and provifions at market always has borne the fame proportion to the demand there is for them, the price would be always invariably and unchangeably the fame. The variation of the prices, therefore, is governed by the variation of the faid proportion. If the demand be greater and the quantity the fame, or the demand the fame and the quantity lefs, the price munt neceffarily advance; and vice verfa, if the quantity fhould increafe, and the demand remain the fame, the price muft as neceffarily fall ; and it is not in the power of man to make it otherwife. But though this immutable relation is heyond our power to alter, we can by art and induftry augment the quantity, and thereby lower the price; cbeapnels being an infallible confequence of plenty, which is the diree object of an improving cultivation. This is a matter of great confequence to the poor labourer, the manufacturer, and the merchant ; and no difadvantage to the grower; becaufe, what he would lofe by the fall of price, he would gain by the increaled confumpt.
is it is not eafy to conccive how many and how great Why the inprovements are which have been made in this who moll important of all arts in thie courfe of the prefent minu century. A patriutic finit of uncommon ardour hath minom gone forti; and the nobility and gentry, like the fe- ties nators of Rome, have fot, as it were, their hands to the ont $t$ plough, and excited their tenants and neighbours to of an practices of which they had no idea beforc. Yea, they freve have done more: they lave inflituted focieties, and try. nade them receptacles and diftributors of ufeful knowledge: they have raifed fupferiptions, and added marks of honour and pecmiary sdvantages to the rewards which uaturally refath from the attention and indullery

## $\begin{array}{lllllllll}H & U & S & B & A & N & D & R & Y\end{array}$

of the ingenious artia. But it mun be allowed, that though much has been done, there Nill remains much more to be done. Experimenters have not always (pethaps but feldom) entered into the views, and ably feconded the intentions, of thofe valuable iuftituions. A nimated with the hope of obtaining the premiums held out by dint of extraordinary exertions, expenfive manures, and a concurrence of forsunate circumilances, more the effect of chance than of defign, they often have been the fuccefsful adventurers, though at the fame time entirely ignorant to what caufes they owed their fuccefs. We two often indeed aicribe cffects to canles which are no way connected with them. The pratice of fuch men is more like the nofrums of quacks, than the recipes of a regular pliylician. The raedicine may be good; but, being ignorant of principles. they know not how to accommouate it as circumitances may require."
Confiderations of this kind mult certainly lead us to fuppufe. that mont, if not ali, the improvemente made in bulbandry for a long time path, are too expentive; and that, though by their means larger crops are now obtained than formerly, the profits are more than fwallowed up by the enormons furs required to produce them. Hence we lave as yet obtained only larger or more elegantly formed leafis of dititerent kinds; and whether this acquiftion is uhimately to be contidered as profitalle, remains get to be determined. Uufortunately this fentiment feems to be confirmed by taking a review of the agricultural improvements mace daring the lall halfoentury. Tliefe are:

1. Intruvemarts in the Airt of Tillage. Improvements of this kind confilt in more perfectly beaking and pulverifing the foil, and keeping it more free from weeds than furmerly Mr Jechru 'Iull was the author of thefe, and thowed the advantages thence arifing. By fiequent turning over and pulverifing the foil, we not oulv deftroy the weeds very effectually, but likewife gruhs, beetles worms, and maggots of many different kinds. "Nothing (fays Mr Wimpey) fo effectually prevents the ravages of the feveral tribes of fubterraneons infects as the frequent tirring and crumbling the ground: I have had large patches of feveral poles fyuare in a field of beans deftroyed by the grub of the cock-claffer ; and many hundreds of cablace plamts by a grey grub of fmaller fize. both thefe excoute thair mifhief underground. The former eat the roots of the beans even when in kid; and then they wither, fall, and die: the latter bites ulf the ftem of the plant jult under the furface, and does infitite mifchicf: but 1 have always found tillage, duly performed, capable of dethoying the whole race."
2. Inverntion of niw Inplemurns of Ahformiry, or im. provements of the old. 'This clafe incindes all the new invented plowilis. hariows, horfe and hand hoes, \&e. by mears of which it is generally firpofed that the work of tillage can be forformed at much lefs expence, as weil as more offestually, than f. merty.
3. Saving a great quandily of Seed in forecina. and the produsion of buther Crops, ty the more vegutar dijfithution of sebat is fown This improvement chiefly confilts in drilling. intlead of foning in the broad-cat way as formerly. The gais is here evident; and Mr Wimpey calculates it at a tenth or swelith part of the whole produce: and if the community ate not yet fenfible of Vol. VIII. Part 11.
any advantage from fuch a confiderable faving, it muf be becaufe the drilling hufbandry thas nut yet become very general.
4. Suiting the Crop to the Nithure and Condition of the Soil. The farmer is now enabled to this better than formerly, by the introduction of a number of new vegetables formerly unknown. Thus, as there are many grounds very untit for the production of wheat, there is now no occation for reaping fcanty crops of it from fuch as are little adapted to the salfing of that grains: becaufe another article, for which perliaps there was formerly no demand, may now be raffed with conficeriable profit on a foil where wheat will not grow to any advantage.
5. The Rotation of Crops. Thus a very confiderable addition is made to the prodnce of the ground by keeping it perpetually fertile; whereas fornerly it was often worn out and readered barren by too frequent croppiner, when a proper rotation was not known.
6. The fitroudidion of now Matures. Thefe are principally lime and manle; of the action of which an accumat is given under the article Aciricultura, $n^{2} 20$.
7. The introdution of many newu Aricies into FieldCallure. Thefe, whatever profit they may yicld to the farmer, confitl principally of provender for catele. They ought, however, to have a contiderable effect in producing plentiful harvells, as here by the eatele nay be fuppofed to do their work more perfectly, and to be mamained at leís exponce than before.
8. The Application of the fo to the rearing and fattoring of Cathe. The good (lletes of this ought to be felt partly in the manner montioned ia the furmer article, and partly in lowering the price of flefh-meat, and confequently of all other kinds of provitions.

Thus we fee, that in the cuurfe of half a century, Liete ad. methods have been found of eradicating weeds, defroying intects, faving vall quantities of feed-com, of fuit- .ingirom ing the crops to the foil, of ufing new manures, raifing new plants; and all this, togther with multitudes of new machines for performing in a better manner the operations of agriculture, has appatently amounted to mere nothing. The price of provitions leems to have begun to tife with the improvements, and to be consinually advancing. It is by no means in our power to point out particularly the caufes of fo difajrecable an event. It mull, however, undoubtedly depend on fome mifcalcubation or over-rating the protits wh ch have arifen fromeerning
 thofe improvements: whence the landholders have uniformly been induced to raife the ir rents, whate the farmers, finding the ir expences greath augmented not only on account of the advance if rem, but likraife foom the mure cofly modes of tillage, have be nubliged wa g. ment the prices of their grain beyond what the inereafed influx of money into the kingdom woald hear. - woh mifcalculations are not uncommun in e"cry buffuctio. A manufacturer is apt to be enticed by a certainty of having an increate of his suods in a given tine : but frequen ly, when improvements are tried, it is found that the abfolute expence, or the quantry of labour "qumite (0) promluce the increafe, is greater than the angnemation of profis can bear; and he is afteward, with regret and lofs, ubliged to lay alide the mprovemente tom which he bad once fuch hopes. In like namner, we lear. it has fared with the hufbandman. The improvements

## $\begin{array}{lllllllll}H & U & S & B & N & D & \mathrm{R} & \end{array}$

in humandry originated principally among the landholders; whofe prineipal view, we may fuppufe, was an augrmentation of rent. 'The tenants were obliged to attempt improvements in order to pay the advance, as well as by the exprels order of their hadords. Hence they were induced to keep a great number of horles, that their lands might be tilled with fufficient expedition, and in a more penfect manner than before. The oxen, formerly made ule of, and which anfwered the purpoles both of provinon and labour, were difearded, and a fet of mont expentive unimals, ufelela except for the purpofes of labour or pleafure, introduced in their theat. A vall quantity of grain, which ought to have Gufained the human fpecies, was thus beflowed on the brute creation: and though this might in fome mealure be fuppofed to be counteracted by the inereafe of crop in confequence of employing horfes, it is erident that it has not anfered the general expectation; lince we rosy fay, that the farmers have not been able to pay one penny of advanced rent without advaneing alfo the price of their grain.
ly doubfful. The mota cxunvagant prices lave been given for the beft breeds as they are called; but it remains yet to be proved, that thefe breeds are really nore ufefil to the comatry than the fmaller ones. The expence of keeping them is unduubtedly greater, and this expence is cintanced by the large cattle being, generally lels hardy than the finaller. It feems, befides, impolible that ene large horfe, for inflance, can be equally yffel wih two frall ones, even though he fhould be as throns as both; for this plain reafon, that two horice, though ever fo fruall, can be put to two different kinds of work at once, which cannot be done with the largeff fingle horfe imaginable. The like is applicable to black catile: Wec cannot fuypofe the larget fingle os to be equal to two ordinary oxen, though he may perhaps require more to faten him than wuild bring to market three or four of an ordinary quality; and fo of other aninals.
It is musch to be fearcd that the fame reafoningextends to molt of the improvements hitherto made inluubandry. The regetative powers of the earth cannot be made always to exert themfelves to the utmolt, without an cxperice which the increafe of produce can by no means balanice. By a tetal neglect of culture, indeed, the foil will produce little or nothing ; by a moderate degree of culture the produat will be greatly augmented, the farmer will be enabled to pay his rent, and at the fame time to afford his grain at fuch a price as can allow the labourers to live comfortably : but if we go on with extraordinasy nethods of cullure, expecting to increafe the pronce of the foil, and to be able to exact an ang. mentaiken of rent ad inffitunn, we will certaialy be deceived ; fos thus the price of provitions mall be intaritely increafed alfo. Thus, indecd, the produce of the ground will be fomewhat increafed, but the farmer will whimately te a lofer; fo that, to fave himfelf from ruin, he muft at lait burchen the public bo:l w with las advanced rent and the expence of mall of his improvements, by advancing the price of grain and of all kinds of provifiors.
Such fecm in feneral to be the reafons why the country has reazed fol litele adrantage by the improvements
made of late in the affairs of agriculture and hußandry. If experiments are now to be made, it is plain that they ought to be with a view to determine that medium of culture which the grownd can bear with the greatelt profit, comparing the expence and produce of the two different modes together; and that mode which is the leaft expenfive onght undonbtedly to he chofen, even though attended with no more profit than that which is executed at a greater expence. Thus, if a farmer, by laying out $5 \%$ can produce a crop equivalent to $7 \%$ he nught undoubtedly to pefer that to a mode of cultivation by which he lays out leven to procare nime. Nay, though by his new method he fhould procure 9 $/$. $10 s$. by laying ont $7 \%$. it woald flill be evidently for the good of the community that the former method were followed. The reafon of this is, that every expence of the loufondman, as well as of cvery other, mult ultimately be defrayed by the community at large. Thus if the huflandman employs a greater number of hands than would otherwife be necellary, it is plain that the expence of thefe mult be defrayed by the community, not only becanfe of the provifions they mul neceflarily confume, but becaufe each of thele, were he not employed in that particular way, might contribute in fome other towards his own fupport and that of others: and the very fame may be faid of the farmer who employs a greater number of horfes than would otherwife be necellary. Now, in the example juil given, the farmer, or the community ai latge, by laying out $5 \%$ gain 40 . which is 40 per cent.; but in the other cale, sia. that of expending $7 /$. for a return of $9 / 10 \mathrm{~s}$. the farmer indeed gets 50 s. intead of 40s. but the community do not gain equally, having now not quite $3^{6} \mathrm{fer}$ cirt. interad of 40 which they had before.
Hence it becomes evident, that by encouraging individuals to expend large fums on agricalture, and thus dimininh the papportion of the ir own profits, the community mult always fuffer, and a rife of provifions will. infallibly take place, whecther the individuals enrich themficles or not. Fivils of this nature can be remedicd only by the legiliature : but it is to be feared that the time is yet very dittant when any certain mode of culture will be eftablithed by law; and until this happen, it is vain to think thas eifher the fipeculations or experiments of individuals or of focieties will be atiended with much benefit to the community, whatever advantage particular perfons may fometimes derive from them.-L caving this fubject, therefore, we -fall now proceed to thofe which more immediately relate to the bufnifs of humbandry in its prefent tlate.

In confidering this fubject in its full estent, it cridently divides itelf into thrce parts: the forli, Relating to into thre the cultivation of fuch vegetables as are proper fur the fublittence of mank ind or the rearing of catte; as grain, guafs, cabbage, turnips, and other vegetables of that kind: the feconl, Such as belong more particularly to trade and commerce ; as flax, hemp, hops, bees, timber, \&c. Under hoth thefe are included the knowledge of various manures, of the nature of different foils, \&c. The thirel part includes, the riviting and managenent of cattle, poultry, of the dairy, wih other adventiuisus articles, lefs connected with agriculture ; of all which we fhall now tecat in order.

Part.

# Part I. Of the Vegetarles moft proper to be raited for the ufe of the Humas Shecies, or as Food for Cattee. 

ANON゙G thofe raifed for the ufe of mankind, wheat has univerfally been fuppofed to hold the firlt place, and other kinds of grain to be the next to it; but in modirn times, an author of no mean repusation hans arifen, who endeavours to prove that wheat ought not to be cultivased, nor bread to be eaten. This is M. Linguct, who has writen a treatife exprefoly upon the fubject; and, ridiculous as the afiertion nasy feem, has been thought worthy of a formal refutation by Dr Tifilit.-One of M Linguet's arguments is, that wheat impovetithes the ground on which it grows: but in oppolition to this, Dr Tiflot urges, that corn is more taily celtivated than grafs; and that confequently, in the comsry lie fpeaks of (Switzerland), the befl lichlds are aipropriated to !ay, and the wort to corn. "If there are fome dilliets of very poor land (fays he) almott enticly fown with corn, they are not poor becaufe they produce only corn, but becaufe they are not fit to produce any thing elfe. Their foil is fo bad, that they can grow hat very litile fodder: confequently they maintain only fuch catte as are abfolutely neceflary for labour: and thofe are ill fed, and frequently periih. Thacy have but little manoure, and their crops are fmall ; for large crops of all furts can only be expected from lanis naturally rich or Arongly manured. 'Thus the poterty of the inhabitants is only owing to their poffefling an ungratuful ioil.- What proves evidently that it is the natural foil which is in the fault, and not the corn which imporelithes, is, that where there is meadow and arable land, the price of the meadow land is much mure confidurable than that of the arable. In molt parts of this country the proportion is nearly ten to one; and there are even lome meadows, for one part of which they would give 30 of field-lands; and fome of vines, for which 100 of arable would be given. Thofe dillricts where the foil will produce nothing but corn, are poor; but in thofe which furnifh fodder, and alfo tine crops of grain, the inhabitants are wealthy and lappy, unle ts they are oppreffed by taxes."
M. Linguet draws another ubjection from the length of time required to cultivate wheat; but Tiflot, by another calculation, fhows, that 48 days work through. out the year would cultivate more wheat than is Tuffi. cient for a family" of lix perfons. "The time neeffary for cultivation of arable land alio does not increafe in proportion to its extent; but in cafe more is cultiva. ted than is requisite for the fublitence of the family, a trade is formed, which might be increafed to an unlimited extcor. He then compares the time requilite for the cultivation of vines which are recommended by M. Linguet, and tinds it to be much longer than that required for wheat. "I know very well (lays be) that the one requires cattle, and the other does not : but thefe catcle, far from being expenfive, will, if propenly managed, increafe the gain of the farmer; therefore they mutit not be looked upon as any expence. Corn is fubject to many accidents but vines are fubject to many more: thofe which the vines fufler, fometinacs

Spoil the vintage for 「everal years; whereas thofe which happen to arable land, only fpoil the crop for the feafon: and as the expence of cultivating vines, for which only manual labour can be employes, is much more conliderable: therefore the zigneron (or perfon who cultivates wines), who engages more largely than the famer, will contequently be a much grater lofer if un-fucecliful.-Hay is alfo fuiject to frequent and very difagreable accidents; the fecuing it is fometimes very difficult ; and, when it is badly made, it is very hurtful to cattle.-A fingle fact will be fufficient to prove the cafualtes to which hay is fulject ; siz. that it varies in price as much as grain. Accidents of hay-mows taking fite are but too frequent ; and this is not to be feared in corn-mows."
The other objections of M. Linguet to wheat appear to be quite frivelons; fo that concerning the cultivation of this grain. Dr Tillot draws the following conclutions: "It appears then, frem what has becn faid, that wheat is not a commocity that is imporetifhing in it felf; and that this grain will grow indifferently at leaf in lands and fituations which are unfavoluable to other plants. This grain is likewife adapted to molt climates; and if there are dilliciets almont entirely fown with wheat, and yit poor, it is the fault of the fuil, and not of this ufeful glain."

But the mon extraorlinary argument periaps ever thought of on this fubject is M. I inguet's affertion, that the ufe of wheat, or bread made from it, is detrimental to population; and that the countries where this grain is ciativated are poor and thialy intabited, whereas thofe which abound with vineyads and pathere-lands are rich and populons. But this, in 1)r Tilfot's opinion, hows orily that one foil is more rich than anothert, and that a futile foil with maintain molt inhabitants. "No periven (fays he) is more capable of afligning the caufe of the fubjection of the Roman cm pire to the nomhern powers, zhan Mt. Linguet ; but he cannot furcly be ferious when he fays, that they were enabled to conquer them becaufe thofe northerri countries produced no corn, and that population decreated fince the introduction of grain. I hall make three Cbicrvations on this paffige: Firl, the armies of Gullavus Adolphns, Charles XII. and the king of Pruffia, whofe food was bread, would be as formidable againtt the Italians of thofe times, who eat lefs than was caten in the days of Scipio, as their ancellors ware 1400 years ago again? the Romans: and M. Linguet mut certainly know, that thofe Grecks who fubfilied on brad, thofe Romans who eat nothing but bicad and regetables in pottage, fubdued all the known world, among whom were many nations who ate lefis bread than themefles. A Roman foldicr's allowance of bread was much grcatet than what foldiers have at prefent; and by the ufe of this food they had much inote Alrength than our modern foldiers can boall of. The all wance to a Roman foldice was $6_{+}$pound of wheat per month; and this be was arictly forbidden
either
either to fell or exchange. Their foldiers had very on account of the inceafed demand for milk, cream, feldom any cheefe, bacon, or pulfe; fo that wheat was almont their only food, aud the proportion was doable what is allowed foldiers in our days. They ate it in hrad, in flour milk, and in thin cakes; and they were not fubject to epidemic or putrid diforders, which is too mach the cafe with our modern armies. We may eafly judge from the weight of their aceoutremenc:, that the Roman foldiers were not poffeffed of lefs perfonal ftrengeth than thofe which compofe the armies at this day; they were not left have, nor did their food render them in any way unhealthy: on the contrary, where there is fuch difficulty in procuring a fupply of good anizal food to an army, as is ofecn the cafe in inodern times, it is probable that reducing them to the fimple diet of a Roman foldier would be the molt proper method of preventing enidemic difeafes among them. Secondly, it is very doubtful whether thole countries were more populons formerly than they are at this time; it is even probable that they were lefo fo. Lafly, the people of thefe northern cominies were not without wheat; it was the bafis of their food and driak: withont quoting other authons who attell it, fuffice it to fay, that Tacitus affirms it," \&ec.

In this lat particular, however, eur author appears to be miltaken ; but whatever may be in this, we apprehend that few of our readers will entertain any doutt concerning the wholdfomenefs of wheat, or the propriety of making it into bread after once it is eultivated. The truly important mater is to determine, whether it be a profitable crop or not for the perfon who cultivates it? In this refpect indeed it has been condemned by the generality of farmers, and dairyfarms are miverfally fuppofed to be more profitable than fuch as produce corn. The valt fuperiority of the former is fert forth by Thomas Davis, Efq; of Longleat, in the following words. "Experience fufficiently evinces the extreme difficulty of perfuading tenauts that they get more (generally fpcaking) by feeding their lands, than by ploughing them; yet it requires very few arguments to convince a landlord, that in cold wet lands efpecially, the lefs ploughed land you have, the lefs you put it in a tenant's power to ruin your ellate. That a tenant of 601 . per annum on a dairy farm will get money, while a corn farm of the fame fize will farve its occupier (though perhaps the former gives 15 s . per acre for his land, and the latter only 108 .), is felf-evident. The plough is a friend of every body's, though its advantages are very far from being particularly and locally felt; rorn being an article that will bear keeping till the whim or capriee, or fuppofed advantage of its poffeflor, call it forth. But the produce of the cow is far otherwife. Checfe mult neceffarily be fold at a certain period: it is a ponderous aricle; and onetwelfth, or at leall one-fifteenth, of its value, is often paid for carrying it to a fair 50 miles off; and the butter and fkimmed milk find their way $n$ 's great diAlance from home, as is evident by the price of butter varying frequently one-third in 20 or 30 miles. Every inhabitant of Bath mult be fenfible, that butter and cheefe have rifen one-third or more in price within 20 years. Is not this owing to the great encouragement given to the plough and to grazing, at a time when,
butter, and cheefe, every exertion on behalt of the dary thould have been encouraged?" sce.

In fome remarks on this leter by Mr Billingley, the fame luperiority of dary-farms the the arable kind is afferted in the mont pritive terms. "Perlaps (fays he) there cannot be a dronjer pronf of the inferiosity of the plough with refpect ta protit, than the fuperior punctuality of the dairy farmer in the payment of his rent. I'his obfervation, I believe, mot thewards who fuperintend manors devoted partly to corn and partly to dairy-farms, will verify; at lealt I have never met with one who controverts it. Sat perhaps the advocate for the plough will detire ne not io confound the abufe of a thing with its intrinfe execllence; and fay, that the generality of corn farners are mont egregions lovens; that lands devoted to the plonginare not conlined to fuch a mediocrity of prolit a; zos. per acre ; that the produce of artificiad grafles (withou: which a well manazed arable farm cannot exi't), fa: exceeds that of natural grafs both in refpeet of guan. tity and nutrition ; that the Itraw-yard is a moft conlvenient receptaclefor the cow when frect from the pail. Thefe, and many other reafons, may be adduced to thow the propricty of walking in the middle path, and of judiciouly blending arulle with pafure, in the proportion perhaps of thret of the latter to one of the former."

On thefe letters we fhall only remark, that for the good of mankind we hope the opinions they contain will never come into general praciice; as thus the price of bread naut be raifed fo high, that elre lower clafles of people would be entirely deprived of it. In the Bath Papers, vol. v. p. 43. we have a method propofed by Mr Wimpey of inpproving fmall arable farms in fuch a manner as to make them yield as much milk, butter, and cheefe, as thofe which are kept continually in palture. He agrees with the maxim already mentioned, that fmall arable farins do not afford the ocenpier fo good a maintenance as dairy farms of the fane value; and that the poffector of a dairy farm will do well and fave money, while the former, with much toil and trouble, is ttarving himfelf and fanily. Notwithlanding this, he maintains, that there is an effential difference between ground that is naturally arable, and fuch as is by nature adapted for paflure. Land which is naturally arable, according to him, ean by no means be converted into palture of any duration. "Such as, from a wild thate of nature, over run with furze, fern, buthes and brambles, has been rendered fertile by means of the plongh, muit be kept in that improved ftate by its frequent afe; otherwife it would foon revert to that wild barren ftate which was its original condition. A farm, therefore, which confilts wholly, or almoit fo, of land that is properly arable, muft cuer continae arable; for it is not practicable to render it in any degree fertile but by means of the plough, or to keep it loug in that itate even when it is made fo." He is of opinion, however, that by raifing crops proper for feeding eattle, the polterfor of an arable farm may raife as great a number of horned cattle as one who has a paiture farm; the only quettion is, Whether he can be reimburfed of his expences by the produce? "To afcertain this fact
(fays
(fays he), we muft inquire what may be the average expences of keeping a milch-cow on a dairy-farm for any given time. It is faid, upon very good authority, that the expence is gentrally from $31.10 ; 1$. 10s. per annuin. Two acres and an half of palture fit for this wie is fufficient to keep a cow the whole year through, and fuch land is valued at from $25 \%$ to 30 s. per acre. At 25 s. the keeping of each cow would amount to 31. 2 s. 6 d . per annum. A dairy-farin, therefore, confilling of $4^{8}$ acres, at $2 ; 8$. per annum, would amount to 60 l . rent; and the number of cows that might he kept on fucl a farin would be about 20. In the next place, with regard to the expence of keeping a cow upon food raifed in arable land as a luceedaneum for grafs, we are aftiured by unquefionable authority, that a buthel of portatoes given lialf at night and half in the murning, with a fmall allowance of lay, is fufficient to keep thitce cows a-day; by which allowance the ir milk will be as rich and as goond as in the fummer months when the cows are il pallure. An acre of land, properly cultivated with potatoes, will yidd 337 buthels; and the total expence of cultivation, icnt and tithe included, will mot exceed 61. I3s. If three cows eat feven buthels per week, then they would eat $3^{6}+$ buthels in a year ; and 20 cows would confume $2+33$ buthels:" So that, according to this calculation, feven acres and a quarter woull nearly maintain as many cows as on the arable faun could be maintained by $4^{8}$ acres. If then the cultivation of no acre of ground cofts 61.13 s . Llic cultivation of feven acres and a quarter will colt about 481 . We have feen, however, that the rent of a dairy-farm capable of maintaining 20 milch cows, is rot lefs than 60 l . To that the calculation is thus entirely in favour of the arable farm; feven or eight actes of the arable farm being fuperior by 12 l . in valuc, when cultivated with potatoes, to 48 acres of meadow or pellare.ground." ${ }^{4}$ It muft indeed be obferved (adds our author), that in th is flatement no allowance is made for the fmall quantity of hay given to the cows with the poiatoce. It muft be noted alfo, that the account of cultivation is charged with 40 s . an acre for manure, and forme expence for ploughing, which of right is chargeable to the crop of wheat that is to follow. Now, if we deduct 40 s . an acre from the expence of cultivating the potatoes, it reduces the fum to 41.13 s . and the whole expence upon feven acres and a quarter is thus Iefs than 34 l. and confequently the keep of 20 cows is little more than half to the occupier of the arable farm what it is to the occupier of the grazing farm. If this conclution be fairly drawn, and the calculation free from errors, it is matter of the greatelt impor. tance, efpecially to the little arable farmer. It plainly raifes lim from a flate of acknowledged inkeriority to one grearly fuperior."

Our author next proceeds to obviate an objection, "that the whole of his reafoning mult be indecifive, as relating only to potatoss" In oppofition to this, he adduces an experiment made on a pretty large fcale by Mr Vagg; from which it appears, that calbages, when raifed upon arable ground, are nearly as much fuperior to a natural crop as potatoes are. Twelve acres were employed in this experiment, and thofe of an indiffe. rest quality. The rent was 30 s. per acre, and the
whole expence of culture and carting off the crop amounted only to 11 . its. So that all the coft of the twelvs acres was 381.9 . From the produce were fed 45 oxen and upwards of 63 theep; and be was aceneson aflured that they improved as fatt upon it as they do cabbages. in the beft pature months, May, Jane, and July. "Now (fays Mr Wimpey), if inftead of 60 hecp we reckon 15 oxen, or that four thecp are equal to about one ox, in which we cannot err much; then 60 oxen were kept well for three months, or, which is the fame thing, 15 for a whole year, for $381.9 \mathrm{s}$. ; and conk quently 20 oxen would colt $5 \pm 1.5$ s. 4 d. which is not quite 3 l. mure thatit the keeping of 20 cow's would colt in potatoes. Turnips, turnip.rooted cabbage, carrots, parfinips, and fome other articles, by many expeliments often repeated, have beell found quite ad،quate to the fame valuable purpofes; at leate fo far as to be more lucrative than meadow or pallure. Clover and rye-grafs aze omitted, as having been long in general practice; but are in common very thort of the atvantages which may be derived from the cultivation of the other artickes recommended." Sainfoin is greatly recommended: but our author acknowledges that it makes but a miferable appearance the fiflt year, though afterwards he is of opinion that one acre of fainfoin is equal to two of middling pallure ground; for which reafon he accufes the farmer of intolerable indolence who does not cultivate fo uieful a plant. On this fubject, bowever, we mult remember, that the culture of fuinfoin is clogged with the lofs of one if not two crops; which may fometimes be inconvenient, though afterwards it remains in perfection for no lefs than 20 years. The moft advantageous method of railing it he fuppofes to be after potatues. Thus it will thrive even upon very poor ground; as the culture and manure neceffry for the potatoes both pulverife the foil and enrich it to a fufferent degree.
From thefe experiments and obfervations, therefore, Greatquane it appears very probable at leaft, that it is by no means titien of againet the intereft of a farmer to cultivate large quan. heain may tities of grain; and that he may cvein do this in a con- tagenvafy fiftency with raifing as many cattle as he can have oc- raifed. cafion for. Some grounds, no doubt, arc matura!ly fo fitted for palture, that it would bue too expenlive to foree them into arable ground; wut wherever this can be done, it feems proper always to have as mucb arable as pontible, indead of as liztle, which Meifrs Davis and Lillinglty advile. Grain of different kinds, therefore, and particularly wheat, ought to be cultivated by a farmer to as great an extent as polfible; though thefe different kinds can be determined only from the nature of the foil, and certain circumftances arifing from the fituation of the place, for which no particular ruies. can be ziven. A view of the general practice of fome of the principal counties in Eughand, howevcr, may perthaps be of fome ufe to furnith general directions for the farmor.

## Sect. I. Of the Cultivation of Wheat.

Tuerf is perliaps no part of Great Britain where this Culture ir? ipecies of grain is cultivated to more perfection than in whes in Norfolk. Mr Marmal informs us, shat the fpecies Norfub. raifed in that county is. calied the siorfolk red, and
weighs buavier than any other which has yet been introdueed, though he owns that its appearanee is much again! the allertion, it being a long thin grain, refembling rye more than well bodied wheat. About 15 or 20 years ago a new fpecies was introduced, named the Kimillo coll, ayzind which the millers were at firt very much prejudieed, though this prejudice is now got over. A remarkable circumtance refpecting this grain is, that though upon its introduction into the county the colo or hutk be perfectly white, yet fuch is the power cither of the foil or of the mode of cultivation to produce what the botanits call varictics, that the grain in quection is faid to tofe every year fomewhat of the whiteners of its hulks, until they bee me at latt conrelly red with thofe of the former kind. The frouthion and fontheattern parts of the county generally enjoy a flronser and richer foil than the more norther1 , and therefore are more proper for the cultivation of that fpecics of errain. In the northern parts are fone farms of very light foil, where the furmers fow only a frall quantity of wheat; and thefe light lands are called hayley forms.
The greatelt part of the wheat in Noffulk is fown upon a fecond year's lay ; fomeinnes it is fown upoun a firft year's hay; fonctimes on a funmer-fallow ; after peas, turnips, or buck harvelted or plowed under. The practice adoped by thofe who are looked npon as fuperior habandmen in the connty of Norfolk is as follows. The fecond year's lays havin finithed the Wallineks, and bronght the itock-cuttle and harfes thru' the fore-part of fummer, and the firll year's lays havint been made ready to receive his thock, the famer begins to hreak up his old land or lay-ground by a paRice talk. culiar mode of cultivation named rie-balling, in which stix, a par. ticul... made is culture cas plained.
the furrow is always turned toward the unplowed gromad, the edge of the conler palfing always clole hy the edge of the Alag latt turned. This is done at firt with an even regular furrow; opportunty bein5 taken for performing the operation after the lurfuce has been moiltened by a fummer-flower. In this thate his fummer-lays remain ontil towards the end of harvelt, when he harrows and afterwards plows them acrofs the balks of the former plowing, bringing them now up to the full depth of the foit. On this plowing he in. mediately harrows the manure, and plows it in with a flallow furrow. The effects of this third plowing are to mix and effectually pulverife the foil and manure; to cut off and pulverife the upper furfaces of the furrows of the fecond plowing; and thus, in the moll effictual manner, to cradieate or frmother the weeds which had efaped the two former ones. Thus it lies until the feed time, when it is harrowed, rolled, fown, and wathered up into vidges of fueh width as the farmer hinks mott proper. Thofe of fix furrows are molt common, though fome very good farmers lay the ir wheat land into four furrow, and others into ten. furrow ridges; "which laft (fays our zuchor) they execute in a llyle much fupenior to what might be expected from whel-plows." 'They excel, however, in the fix-furrow plowing; of which Mr Marthal gives a particular accomt. When plowing in this manner, they earry very narrow furrows; fo that a fix-furrow ridge, fet out by letting the off horfe return in the firitmade furrow. does not meafure more than three feet right or nine inches.

When wheat is cultivated after the firft year's lay, Wh the feed is generally fown upon the flag or furrow turned over. After peafe, one or two plowings are given; the other parts of the management being the fanse with that after the fecond year's lay alieady mentioned. After buck harvetted he feldom gives mure than two, and fometimes but one, plowing. In the former eate he fpreads his manue on the flubble, and plows it in with a fhallow furrow ; harrows, rolls, fows, and gathers up the foil into narrow work. The manure is in like manner fpread on the ftubble after once plowing, and the feed is then fown among the manure; the whole plowed in tugcther, and the foil gathered up into narrow ridges, as if it had undergone the operations of a fallow. An inconvenience attending this practice is, that the buck which is neceffarily fleed in harvelting fprings up among the wheat, and becomes a weed to it, at the fame time that the rooks, if numerous, pull up buth buck and wheat, leaving feveral patches quite bare. This is obviated in a great meafure by firlt plowing in the manure and felf. fown buck with a flallow furrow; in eonfequenee of which the buck regetates before the wheat.
It is likewife a favourite pracice with the Norfolk farmers to raife wheat after buck plowed under. They plow under the buck by means of a broom made of rungh bulles fixed to the fore tackle of the plow between the whels, which bears down the plant without lifting the wheels from the ground. Sometimes, when the buck is flrong, they firit break it down with a roller going the fence way that the plow is intended to go ; afterwards a grood plowman will cover it fo effectually that scarce a flalk can be feen. Sometimes the forfoce of the ground is left rough, bat it is more eligitle to harrow and 101 it . The practice of fummer following feldon uccurs in Nufolk: though fometimes, when the foll has been much worn down by cropping, and uver-run by weeds, it is efteemed a judicious practice by many excellent hufbandmen, and the practice feems to be daily gaining ground. After turnips the foil is plowed to a moderate depth, and the Ited fown over the firft plowing: but if the turnips be grot in early, the weeds are fometimes fint plowed in with a flallow furrow, and the feed plowed under with a fecond plowing, gathe!ing the foil into narrow ridges.

With regard to the manuring of the ground for mana wheat in Norfolk, that which has becn reccutly elayed the gr or marled is fuppofed to need no other preparation in ${ }^{\mathrm{N}}$ any more than that which has received 15 or 20 loads of dung and mould for turnips; the fir!t year's lay having been teathed in autum, and the fecond fed off. Where the foil is good, and the wheat apt to run too math to ithaw, it is the practice of fome judicions farmurs to fet thir manure upon the young clover, thereby depriving the what in fome degree of its ranknefs; but it is mult common to fpread it upon the broken ground; or if the feed be fown upon the turned limrow, to fpread it on the turf and plow it under; or to fpread it on the plowed forface, and harrow it in with the feed as a top drefling. A finaller quantity of manure is aenerally made ofe of for wheat than for turnips. From eight to ten cartloads (as much as three horfes can conveniently draw) are reckoned fufficient for an acre; three or
four chaldrons of lime to one acre, or 40 buflels of perfect untefs the dibbles come out clean and wear Wheae.
foot to the fame quatity of ground; or about a ton of rape-cake to three acres.

In this county they never begin to fow wheat till after the 1 gth of Octuber, and continue till the bee ginning of December, fometimes even till Chritnas. They give as a rcafon for this late foring, thet the wheat treated ia this manner is lefs ajt to run to ltraw than when fown earlier. The leed is generally prepared with brime, and candied in the ufual manuer with linse. The following methed of preparing it is faid to be effectual in preventing the fmut. "The falt is diffolved in a very fnail quantity of water, barely fuf. ficient for the purpofe. The lime is llaked with this folution, and the wheat candied wish it in its hoteet flate, having been previonly muitened with pure water." According to our anthor's oblervation, the crops of thofe farmers who ufe this preparation are in general more free from fenut than thole who make afe of any other.

The practice of dibbling or fetting of wheat has not as yet becore general throughout Norfolk, the common broad-call inethod being ufually fullowed, except on the Suffolk lide of the county. Some few make ufe of dibbling and fluting rollers; but drilling is al. moft entirely unknown, notwithllanding the great aptitude of foil for the practice. Plowing in the feed under furrow is the favourite mode of the Norfolk farmers, and is performed in the following manner: "The land having been karrowed down level, and the furface rendered finoath by the roller, the head plowman (if at leifire) matks out the whele picce in narrow hlips of about a llatute rod in width. This he does by langing up the plough in fuclo a manner, that no part of it except the heal touches the ground; and this makes a fure mark for the feedfman, which he cannot by any means mitake. In cafe the ploughs are all employed, the feedfman himfilf marks the ground, by drawing a piece of wood or other heavy body behind him." Mr Marliall prefers this to the Kentifh method of fetting up dicks in the form of a lane, as being lefs liable to produce millakes.

In thofe places where wheat dibbled, they make ufe of iron intruments for the purpole. The acting part is an egg-lhaped krob, fumewhat larger than a pigeon's egg; the fmaller end is the point of the dibble, the larger laving a rod of iron riling from it about half an inch fquare, and two feet and an half long; the head being received into a crofs piece of wood refembling the cruch of a fpade or fhovel, which forms the bandle. The dibbler ufes two of hefe inflrumeuts, one in each liand; and, bending over them, walks backward upon the turned furrows, making two rows of holes in each of them. Thefe rows ate ufually made at the diflance of, four inches from each other; the holes being two and an half or three inches diltant, viz. four in each length of the foot of the dibbler. The great art in making thefe lies in leaving them from and fmooth in the fides, fo that the loofe mould may not run in to fill them up before the feeds are depolited. This is done by a circular motion of the hand and wrin: making a femi-revolution every flroke; the circular motion beginning as the bit enters, and continuing unsil it is entirely difengaged from the mould. The operation is not
bright. It is fome what diffecult to make the huics at equal diftances; bit more efpecially to keep the :wo Alraight and parallel to each other, fome praitice being required to guide the intruments in licelt a manner as to correfpond exactly with cach oilier; but though couples have been invented to remedy this inconvenience to keep then at a proper dittence, the other method is lithl found to be preferable. A miduling workman will make four lowes in a fecond. Oae dibbler is fulficient for liree droppers; whence one man and three children are called a fot. The dibbler carries on chree nags or turned furrows; guing on fome yards upon ous of the custide furrows, and returaing upon the other, after which he takes the misule une; and thas kecps his three diblers contantly employed, and at the fame tince is in no dauger of filling up the huke with his fect. The droppers put in two or three grains of whest into cach hole; bur murh time and patience is aceeflary to perh then to perform the bulimets properiy and quichly. All expere dhbler will hode tralf an acie in a day; though olle hirsi of an acre is ufually reckoned a grond diy's work. 'The feed is corcral by means of a buth-barrow; and from one buthel to fix pecks is the ufual quantity for an acre. Notwithllanding the advantages of faving feed, as well as fome others which anc gencrally reckuned undeniable, it is affierted by fume very jufliciuns farmers, that dibbling of wheat on the whole is not really a prolitable practice. It is parsiculandy faid to be produc. tive of weeds unlefs dhbled vely thick; which indeed may probably be the cafe, as the weeds are thus allowd a greater fatee to veretate in. Mr Marfall himfelf is of opinion, that " the dibbling of wheat appears to be peculiarly allapted to rich, diep fuils, on whith three or four peeks dibbled early may fpread fufficiently for a full crop; whereas liflit, weak, thallow foils, which have lain two or three yeare, and have become gralty, require an additional quanticy of feed, and confequemty an addition of labour, otlicrwife the plants are not able to reach each other, and the graffes of courfe tind their way up between therr, by which means the crop is iujured and the foil rendered foul."

The fame anthor las likewife given an accoms of curiture of the nethod of cultivating wheat prattifed in other Lin. wheat in glith counties. In the Midland cifriet, including part dinmiand of Statlordhire, Derby:hire, Warwick, and Leicellerhire, we are infoneded that the fuecies ufually fown is that called Red lanmmes, the ordinary red wheat of the kingdom; but of late a fecies named the EFex dun, fimilar to the Kintibs white rolb ot Nurfolk, and the Fictlford) irc brow of Yorkmire, have been coming into vogue. Concwheat, furmerly in wfe in this diArich, is now out of fathion. Spring wheat is cultivated with remarkable fuccefs, owing principally to the time of fowing; viz. the clofe of April. Our author: was iuformed by an excellent farmer in thefe parts, that by fowing early, as in the beginning of March, the grain was liable ta be fhrivelled, and the fraw to be blighted; while that which was fown towards the end of April, or even in the beginning of May, produced clean plump coro. At the time he vifited this country, bowever, it feemed to be falling into difre-

Whes:.

pute: though he looks upon it, in fame fituations, efuctially in a turnip-country, to be eligible. In the ordinary fuccefion in this part of the kingtom, wheat comes after oats; and there is perhaps nine-tenths of the wheat in this dillict fown upon oat-ftubble. Our author has allo feen a fow examples of wheat being fown upon tuf of fix or feven year's laying; and feveral others on clover ley once plowed, as weil as fome ufter turnips. The bett crope, however, produced in this, or perhaps in any other diftrict, are after fummer fallow. 'The time of fowing is the month of October, little being fown before Michaelmas; and in a favourable feafon, little after the clofe of the month. Muxh feed is fown here without preparation. When any is made ale of, it is the common one of brine candied with lince. The produce is very great, the medium being full thre quarters per acre, fonetimes four or five; aud one farmer, in the year $1-84$, had, on 50 aeres of land together, no lefs than 45 bumels per acre.
In the Vale of Gloucefter, the cone subent, a variety of the triticum turatum, is cultivated, as weli as the limmas and furing wheats. It is not, how ser, the true cone wheat which is cultivated here, the ears being nearly eylindrical; but our author met with the ture fpecies in North. Wiltflire. Beans in this country are the common predeceffors of wheat, and fometimes peafe : but here the farmers cultivate wheat upon every fpecies of foil. The time of fowing is in November and December, and the feed is thought to be fown in fufficient time if it is done before Clrititmas. In this country it is thought that late fown erops always produce better than thofe which are fown early ; but $\mathrm{Mr}^{-}$ Marflall accounts for this by the valt quantity of weeds the latter have to encounter, and which the late fown crops efcape by teafon of the weaknefs of vegetation at that time of the year. The prodnec, however, throughout the Vale of Gloncefter, is but very indiffe-rent-Setting of wheat is not practifed, but hocing miserfally.-In harveiline. Mr Marflall obferves, that the gtain is allowed to ftand until it be unrtafonably ripe, and that it is bound up into very fomall theaves. The practice of making double bands is manown in this difrict ; fo that the theaves are no bigger than can be contained in the kongth of lingle llraw. The inconvenicacts of this method are, that the crop reguires more time to hook, load and unload, and Hack: the advantages are, that the trouble of making bands is avoided: and that if rainy weatl or happens the inter. vene, the fmall theaves diy much ooner than the large ones. Here the crop is cut very literh, the ituble and weeds being mown off in fwaths for litter foon after the crop is cut : and tometimes fold as high as 5 s . per acre.- Mr Mantall is at a lofs to account for the hitile quantity produced in this country; it being hardiy ponible to derive it from the nature of the foil, almolt all of it being proper for the cultivation of the grain.

Among the Cotfwold hills of Gloucefter the lammas and cone wheats are fown; and a new variecy of the hatter was raifed not lonir ago by picking ont a fingle grain of feed from among a parcel. The body is very long and large, bet not fightly.-The Cotfwold hills are almoft proverbial for carly fowing of wheat. The gencral rule is to begin plowing in July, and fowing the lirft wet weather in Augut ; fo that here $N^{\circ} 159$.
the feed-time and harvett of wheat coincide. If in confequence of this early fowing the blade becomes rank in autumn, it is fuppofed to be proper to eat it down by putting a large flock of fleep upon it at once. lating it in fpring is confidered as pernicious. It is ufually weeded with \{pud-hooks; not hoed, as in the Vale. One intlance, however, is mentioned by ont anthor, in which a very thin crop full of feed-weeds was hoed in autumn with uncommon fuccefs, occurred in the practice of a fuperior manager in this dititict; as well as others in which wheat has been weeded in autumn with great advantage. He alfo met with another well authenticated inttance of the good effect of cutting mildewed wheat while very green. "A fine of cu piece of wheat being lodged by heavy rains, and be. mulde ing foon after perceived to he infected with the mil. dew, was cut, though thill in a perfectly green fate: grcea. namely, about three weeks before the ufual time of cutting. It lay fpread abroad upon the flubble until it became dry enough to prevent its caking in the theaf; when it was bound and fee up in thocks. The refult of this treatment was, that the grain, though fmall, was of a line colour, and the heavieft wheat which grew npon the fame farm that feafon; owing, no doubt, to the thinnefs of its nkin. What appears much more remarkable, the fraw was perfectly bright, not a fpeck upon it. - In this part of the country, the produce of wheat is fuperior to that in the Vale; hut Mr Marmall is of opinion, that the foil is much more fit for barley than wheat.

In Yorkthire, though generally a grafs.land coun- Culti try, and where of confequence corn is only a fecon- of w dary concern, yet feveral kinds of wheat are culti. Yor vated, particulatly Zaland, Downy Kent, Common White, Hertford/lire Brozun, Vellow Kent, Common Red. All thefe are varieties of winter wheat ; befides which they cultivate alfo the foring or fummer wheat. Here our author makes feveral curious obfervations concerning the raifing of taricties of plants. "It is prohable (fays he), that time has the fame effect up- tion on the vanieties of wheat and other grains as it has on fing thofe of cultivated fruits, potatoes, and other vegeta-ricti ble productions. Traus, to produce an early pea, the plar garden crmarks the plants which open firt into blofform among the motl early kind he has in cultivation. Noxt year he fows the produce of thufe plants, and goes over the coming crop in the manner he had done the preceding year, marking the earlier of this early kind. In a fimilar manner new varieties of apples are raifed, by chooling the breadell leaved plants amung a bed of feedlings rifing promifeuoully from pippins. Hurbandmen, it is probable, have heretofore been equally induftrious in producing freth varieties of corn; or whence the endlefs varicty of winter wheats? If they be naturally of one feecies, as Limnzus has deemed them, they mult have been produced by climature, foil, or indultry; for although nature forts with individuals, the inderlery of man is requifice to raife, elablifh, and continue a permanent variety. The only inftance in which I have had an opportunity of tracing the varicty down to the parent individual, has occurred to me in this dillrick.-A man of acute oblervation, having, in a picee of whent, perceived a plant of uncommon frength and luxuriance, difufing its branches on every lide, and fetting its clofely-furrounding neighbours
bours at defiance ; marked it, and at larveft removed it feparately. The produce was 15 ears, yielding $60+$ grains of a ftrong-bodied liver-culoured wheat, different, in general appearance, from every other sariety he had feen. The chaff was fmooth, without awns, and of the colour of the grain ; the fraw Itout and reedy. Thefe $60+$ grains were planted fingly, nine inches afunder, filling about 40 fquare yards of ground, on a clover !tubble, the remainder of the ground being fown with wheat in the ordinary way; by which means extraordinary trouble and deltruction by birds were avoided. The produce was two gallons and an half, weighing : $0 \frac{1}{4} \mathrm{lb}$. of prime grain for feed, befides fome pounds of feconds. One grain produced 35 ears, yiehd. ing 1235 grains; fo that the fecond years produce was fufficient to plant an aere of ground. - What duters farmers from improvemerts of this rature is probably the miichievoufneis of birds; from which at harvelt it is fearcely pofible to preferve a finall pateh of corn, ef. pecially in a garden or other ground lituated near an hatitation; but by carrying on the inprovement in a field of corn of the fame nature, that inconvenience is got rid of. In this fituation, however, the botanit will be approhenfive of danger from the flural farina of the furiomsing crop. But from what obfervations I have made, I am of opinion his feass will be groundlefs. No evil of this kind occurred, though the cultivation of the above variety was carried on among wobite wheat. But this need not be brought as an evidenee : it is not unconmon here to fow a mixture of red and white wheats together: and this, it is contidently afferted, without impairing even the colsur of cither of them. The fame mode of culture is applicable to the improvenent of varieties; which perhaps would be more protitable to the hulhmdman than raifing new ones, and more expeditious."

In Yorkfire a very hatsular preparation of feedwheat preveils, wiz, the fleeping it in a folution of arfe. nic, as a preventative of fomut. Marthall was informed by one farmer, that he had made ufe of this preparation for 20 yeas with fuccef, having never during that long face of time fuffered any fonfible injury from fmut. Our athar feens inclined to believe the effecacy of tihis preparation; but thinks there may be forme reafon to applehend danger in the ufe of fuch a pernicious mineral, either through the carelefluef of fervants, or handling of the fied by the perfon who fows it. The farmer above mentioned, however, during all the time he ufed it, never experinned any inconvenience cither to himfelf, the feediman, or even to the poultry; though thefe laft, we hould have thought, would have been peculiarly liable to aceidents from arfenicated feed. - The preparation is made by ponding the arfonic extremcly fane, boing it in water, and drenching the feed with the decoction. "In flictofs (iays Mr Marhall), the arfenic mould be levigaied fufficemty fine, to be raken up and waihed over with waser, reducing the fediment until it be fime enough to he earried over in the fame manacr. - The ufual msthod of preparing the liguor is to boil one nurce of white anteric, fincly powderd, in a gathon of water, from one to itwo hours; and to add to the decoction as much water or tale urine as will inereafe the liquor to two gallons.- In this liquor the feed is, or ought tu be, immerged, liering it about in fuch a Vor. VIII. 13at 11.
manner as to faturate effeatully the downy taid of eacia grain. - This done, and the liquor drawn oft, the feed is confijered as fit for the feed bafket, without being candicd with lims, or any other preparation.-a buhhel of wheat has been obiersed to take up aboet a gallon of liquor. The price of arfenic is about бd. per pound ; wheh on this calculation will cure four quarters of feed. If no more than three quarters be prepared with it, the coll will be only a farthing per buthel; but to this mult be alded the labou: of pounding and boiling. Neverthetefs, it is by much the cheapert, and perlaps, upon the whole (adds Mr Marflall), the bell preparation we are at piefent ac. quanted with.-In this connty it is believed that a mixture of wheat and rye, formerly a very common crop in thefe parts, is never affected with milders; bat our author does not vouch for the truth of this aifirtion.

## Sect. II. Bardey.

The county of Norfolk, according to Mr Mufiall, curtivation is peculiarly adapted to the cultivation of this anain, of barley in the frongelt foil not being too heavy, and the lighter Norfons. being able to bear it ; and fo well verfed are the Norfolk farmars in the cultivation of it, that the basley of this county is defired for feed throughout the whine kingdom. - It is here fown after wheat or turaips; and in fome very light lands it is fown after the fecoisd year's lay.-After wheat, the feed-time of the latter being fininhed, and the flubble trampled down with bullocks, the land is ploughed with a mallow firrow for a winter-fallow for barley. In the begianing of March the had is harrowed and erofs ploughed ; or if it be wet, the ridges are reverfed. In April it receives ar:other ploughing lengthways; and ai feed-time it is liarsowed, rolled, fowed, and the furface rendered as finuoth and level as poffible. After turnips the foil is Erolienn? as fatt as the turnips are taken off; if early in winter by rice lutking, a practice already explatad'; but if 'Scen.' 2 -, late, by a plain plowing. It is common, if tine will permit, to plough three times ; the firl fillow, the fecond full, and the third a mean depth: with which lat the feed is plowe! in. Sonetimes, howerr, the ground is ploughed only once, and the feed fown abres; but more frequently by three ploughings, thonghperhay, the farmer has not above a weck to perform then in. -After lay, the turf is gener lly broken by a winter fallow, and the foil treated as after wheat.

This grain is feldom manalued for, except when fowa after lay, when it is treated as wheat. No mane is requifite after iumips or wheat, if the lateer has been manured for. If not, the tarniperop foll wing immediately, the barley is left to take its ehanic, laler ${ }_{3}$ the oppurtunity be embraced for winter-marlius.

Little barley is fown by the Nurfolk farmers bee fore the midale of April, and the feed time generatly continuestill the middle of May; though chio munt in fome meafure depend oa the feafun; "which (tays Mr. Marthail) is more attended to in Norfolk than pir. haps in all the world befide." In the very bichward fpring of 1732 , barley was fown in June with fuecefi. No preparation is ufed. It is all fown briod cat, an:! almoft all under furrow; that is, the furfuce havias been fmoothed by the harrow and roller, the feed is 5 A Sowa
fown and plowed under with a fhallow furrow; but if the feaion be wet, and the foil cold and heavy, it is fometimes fown above; but if the fpring be forward, and the lat piece of turnips eaten of late, the ground is fometimes obliged ro be plowed only once, and to be fown ahow; though in this cafe Mr Marfhall thinks it the molt eligible manarement, intlead of turning wer the whole thicknefs of the foil, to two-furrow it, and fow between. This is done by only fkimming the furface with the fre! plough, fowing the feed upon this, and then covering it with the bortom-furrow brough up by the focond plough. Three buftels are ufually fufficient for an acre.

The barley, as well as the wheat, in Norfolk, is allowed to fand till very ripe. It is univerfally mown into fwath, with a fmall bow fixed at the heel of the feythe. If it receive wet in the fwath in this countiy, it is not turned, but lifted; that is, the heads or cars are raifed from the ground, either with a fork or the teeth of a rake, thereby admitting the air underneath the fwaths; which will not fall down again to the greund fo clofe as bcfore, fo that the air has free acecefs to the under fide: and this method of lifting is fuppofed not to be inferior to that of turning, which requires more labour, befides breaking and rufling the fwaths. Ta the vale In the Vale of Gloucefter the quantity of barley culof Cloucd tivated is very inconfiderable; the only fpecies is the * w . comnon longeated barley, bortlum zeorriton. In this county the grain we fpeak of is ufed, on the every year's lands, as a cleanling crop. It is fown very late, aiz in the middle or end of May; fometimes the beginning or cven the middle of June. The reafon of this is, that the people of the Vale think, that if a week or ten days of tine weather can be had for the operation of harrowing out couch, and if after this a full crop of barley fucceed, elpecially if it fhould fortunately take a reclining polture, the buinefs of fallowing is effectually done, infomoch that the foil is cleantd to a fufficient degree to latt for a oumber of years. 'A great quantity of leed is made ofe of, aiz. from three 10 four buhtels to an acre; urder the idea, that a foll crop of tarley, efpecially if it looge, fmotbers all kinds of weeds, couch-grafs iLelf nete excepted. Our author acknowldgres this effect in fome degree, but does not recommend the practice. "If the land (fays he) be tulerably clean, and the feafon favourable, a barley fallow may no donlt be of effential fervice. But there is not one year in tive in which even land which is tolerably clean can be fown in feafon, and at the fainc time he much benclited by it for future crops." The barley in this county is all tiand-weeded. It is harvelted loofe, mown with the naked feythe, lies in fwath till the day of carrying, and is cocked with common lay forks. The medium produce is three quarters per acre. Its quality is pretimble to that of the hillbarley.

\end{aligned}
$$

In the Midland diatrict they cultivate two foecies of barly, viz. the zeocriton or common long eared, and the diffichon or fprat barley; the latter not being of 10 the Ma more than 50 years flanding, but the former of much land diolder date. The fprat is the more hardy, and requires ftift. to be more early fown; but the long ear yields the better produce. It fucceeds wheat and turnips; but on the flrong lands of this diftrit, the crop after wheat is much lefs productive, as well as lefs certain, than af. ter turnips; which circumRance is likewife obficred in Norfolk. It is fometimes alfo fown with fuccefs upon turf. When fown after wheat, the foil is winter-fallowed by three ploughings; the firil lengthways in November : the fecond acrofs in March; the latt, which is the feed-plowing, lengthways. Between the two laft ploughings the foil is harrowed, and the twitch fhaken out with forks; alter which it is left loole and light to die upon the furface, without being either burnt or carried off. After turnips the foil has commonly three ploughings ; the reafon of which is, that the turnips being commonly folded off with theep, the foil, naturally of a clefe texture, reccives a till greater degree of compactnefs, which it is proper to breals down, and render it porous. The leed-time is the two laft weeks of April and the firit of May; from two buthels and a half to three buthels an acre, fometimes even as much as four buthels; the produce very great, fometimes as high as fiven or even eiglat quarters an acre; but the medium may be reckoned from four to four and an half quasters. Mr Marflall remarks, that the culture of barley is extremely difi- Culture cul:. "Something (fays he) depends on the nature cult. of the foil, moch on the preparation, much on the feafon of lowing, and much on harveting. Upon the whole, it may be deemed, of cora crops, the moit diffi. cult to be cultivated with certainty."

In Yorkthire there are four kinds of barley culti- In ${ }^{43}$, vated, via. the zeocriton or long-eard, the difichon hine. or iprat; the vulgare, big, four-1owed or fpringbarley; and the haxaflichon, fix-rowed or fpring-barley. The firtt and third forts are principally cultivated; the winter.baley is as yet new to the ditrict. Battledoor-barley was formerly very common, but is now almolt entirely difufed. Mr Marhall obferves, that lefs than a century ago, barley was not faleable until it was malted; there were neither malthers nor public houles, but every farmer malted his own grain, or fold it to a neighbour who had a malt-kiln. Brakes cut from the ncightouring commons were the fuel eommonly ufed upon this occation, and a certain day for cutting them was fixed, in order to prevent any one from taking more than his thare. The cafe is now rotally reveried; even pullic malt-houfes being unknown, and the butinefs of malting entirely performed by maltters, who buy the barley from the farmer, and fell him what malt he may want for his family.

## Secr. III. Oats.

In Norfolk this kind of grain is much lefs cultiv3- Norfult ted than barley; and the only fpecies obferved by culuri. Mr Marflall is a kind of white oat, which grows quick-tion of ly, and feems to be of Dutch extracion. They are vass. cultivated occafionally on all kinds of foils; but more efecially on cold heavy land, or on very light, unpro.
ning of April, from four to feven buhtels an acre: the produce is in propostion to the feed, the anedium
du:Ctive, heathy, foils. They moft frequently fucceed wheat or lay-ground hirlcy: "hut (fays our author) there are no eftablifhed rules refpecting any part of the culture of this time-ferving crop." The culture of the ground is ufnally the fame with that of barley; the ground generally undergoing a winter fallow of three or four ploughines, though fometimes they are fown after one ploughing. They are more commonly fown above furrow than barley. The feed time is made fubfervient to that of barley, being fometimes fooner and fometimes later than ba:ley feed-time: and Mr Marfhall oberees, that he has fometimes feen them fown in June; it being obfervable, that oats fown late ripen earlier than banley fown at the fame time. The quastity of feed in Norfolk is from four to five buhels per acre: but he docs not acquaint us with the produce. He mentions a very fingular method of culture fometines practifed in this county, viz. ploughing down the oats after they begin to vegetate, bur before they have got above ground; which is attended with great fuceefs, even though the ground is turned over with a full furrow. By this me:had weals of every kind are defloyed, or at lrat checked in fuch a manner as to give the crop an opportunity of getimy above them; and the porolity comnumeated to the forl is axcllently well adapted to the intant-plants of barley; which probably might frequetuly receive benefit from this operation.

In the Vale of Cloucefter, Mr Marfhall obferves, that the wild oat is a very troublefome weed, as well is in Yorkthire; and he is o! opinion, that it is as truly a native of Great Butain as any other arable weed, and is perhaps the mof difficult to be extirpated. It will lie a century in the foil without lofing its vegetative quality. Ground which has lain in a ftate of grafe time immemorial, both in Gloucefter and Yorknire, has produced it in ahundance on being broken up. It is alfo tridowel with the fame feemingly inftinetive choice of feafons and ftate of the foil as other feeds of weeds appear to have. Hence it is exceffively difficult to be usercome; for as it ripens before any crop of grain, it theds its feed on the foil, where the roughnefs of its coat probably fecures it from birds. The only methods of extirpating this plant are fallowing, hoeing, and handweeding, where the laft is practicable, after it has fhot its panicle.
No oats are cultivated in the Vale of Glouct fler; though the wild oat grows cuery where as already faid. Mr Mathall is of opinion that it is better adapted to oats than to barlcy. The reafion he affigns for the preference given to the latter is, that in this part of the country the monks were formerly very numerous, who probably preferred ale to oaten cake. - He now, however, recommends a trial of the grain on the Atronger cold lands in the area of the Vale, as they feldom can be got fufficient!y fine for barley. The fodder from oats he accounts much more valuable than that from barley to a dairy country; and the grain weuld more than belarict in quantity the comparative difference in price.

In the midland diftriet the Poland oat, which was formerly in vogue. has now given place to the Dur or Frizeland kind. It is contlantly fown after turf; one plowghing heing gisen in February, March, or April. The feed-ume is the lattor end of March and terein.
being about fi: quarters.

In Yorkfhire the Friczeland oats are likewife pic. In \&ote. ferred to the Poland, as affordin:r more fraw, and be- ${ }^{\text {andes. }}$ ing thimner fkinned than the latter. The Siberian, or Tartarian oat, a 「p:cies unnotied by L'mnens, is likewife cultivated in this councry: the real cat is known, hue has not yet conc into any great chitiration. The grain is light, and the Htraw too ready to be affected hy catt'e.

Oats are particulaly cultirated in the weftern divifron of the Vale of Yorkhire; where the fail is chiefly a rich fandy loam, unproductive of what. Five or lix buthels, or even a quarter of oass, ase fumetimes fown upon an acre; the produce from fiven to ten quarters. - In this councry they are threfhed in the singur open air, and frequently even upon the bare ground, mithod of without even the ceremony of interpofing a cleet. The theshang. reafons alligned for this feemingly Aranke pratice are, that if pigs and poulery be employed to eat up the grain which efcapes the broom, there will be litile or no walte. Here the market is always sery great for new oats, the manufacturing parts of Wed Yorkfhire ufing principally oat-bread. The only wbjection to this practice is the chance of bad weather; but there is always plenty of firaw to cover up the threfhed corn, and it is found that a little rain upon the frax does not make it lefs agrecable to catle.
In an experiment made by Mr Bartley near Brilol, Buob $P_{a}$ upon black oats, we are informed that he had the pro-fers, voll it digious increale of $9^{5}$ S Winchetter buthels from four $\mathrm{P} \cdot 3 \mathrm{~s}$. on the acre: the land was a deep, mellow, fandy Expetimes: loam. It had carricd potatoes the former year, and on blac:s received one ploughing for a wiuter fallow. Another oats. ploughing was given it in Febriary, and the feed was fown on the 27 th and 2 Sth of the month. The fuccefs of the experiment was fuppofec to be owing partly to the eariysfowing and partly to a good decip cillage.
Sect. IN. Piafo.

In the Bath Papers, vol. i. p. 148. we have an account of the fuccefs of an expeciment by Mr Pavier near Taunton, un fowing peafe in drills, a method mentioned under the article Agriculiturf, $n=150$. The frale on which this experiment was made, nowever, on fettiry being fo fmall, it would perhaps be rafh to infer from drills io It what might be the event of planting a large fiece of ground in the fame manner. The fpace was only16 fquare yards, but the produce fo great, thas loy calculating from it, a flatute acre would yield 600 , or at the leatt $5 c 0$ pecks of green peafe at the firlt gathering; which, at the high: price they bore at that time in the county atout 'Taunten, aiz. 1Gd. per peek, would have amometed to 3.31. 6s. SJ. On this the Society observe, that though they doubt not the trith of the calculation, they are of opinion, that fuch a quartity as $; 00$ or Geo pecks of green peafe would imasedietely reduce the price in any country maker. "If the above-mentiuned crop (fay they) were fold orly at nine pence per peck, the farmer would be well paid tor his rrouble." In a luter on the drill humbandry by Mr Whitmore, for which the thanks of the fociety were rcturred, he informs us, that drilied feafe muat
not be furn tho thin, or they will aluays be foul ; and is an experinent of this kind, notwithillanding careful hoeirg, they turned out fo fol, that the produce was on!y ci,fle buthets to the acre,- From an experiment ralited in the git volume of the fame work, it appears that peafe, however meliorating they may be to the ground at lirl, will at the belt totally exhant is, at leal with regad to themflves. In this experiment they wete frow on the fame fpot for ten gears running. Aficr the fill two years the crop became gradually lef and lels, wintil at lat the fecd would not vegetate, but became putrid. Strawberries were then phanted without any monure, and yicid d an excellent crop.
Oa the Norfork culture of peafe*, Mr Mathall makes swa ubfervations. "Lays are feldom ploughee! mare than once for peafe; and the feed is in general dhaled in upon the flay of this one plonghing. Bur Hubbles are in pencal broken by a winter fallow of thee or four foughings ; the feed being fown broadcan, and phombed in about three inches deep with the Iall plonghing." - In the Vale of Gloucelter they are plante by womert, and hood by women and children, once, twice, and fonntimes thrice: which gives the crop, when the foll is fufficiently free from root-weeds, the afpearance of a garden in the fumner time, and produces a plentiful crop in harvef. The difance between the rows varies from 10 to 14 inches, but 12 may be confidered as the medium; the ditance in the rows wo inches. In the Cheltenham quarter of the dindiet, they fet the peas not in continued lines, bur in chunps: making the holes eight or ten inches diftant from one an ther, putting a number of peafe into each hole. Thus the hoe has undoubtedly greater ficedom; $\because!l$ the difadrantage is, that in thas cafe the foil is nut fo evemly and fully uecupied by the roors as when they are difpofed in continned lines.- In Yorkthie it is comenon to fow beans and grey peafe together, under the name of bumutits ; and fometimes fitches (probably, fays M, Mathall, a gigantic varicty of the erainn lans) are fuwn among beans. Such mixtures ale found to augment the crop, and the dif. firent fpecies are ealily feparated by the five.

Thefe are the molt remarkable particulars concerning the culture of corn not taken notice of under Agriculture: but belides that kind of vegetables called Grans, there is a number of others very important both, for the ufe of men and cattle, of which we muft now treat particularly.

## Sect. V. Potafors.

Thesf, next to the different kinds of grain, may be looked upon as the crop moft generally ufeful for the hufbandman; affording not only a molt excellent food for cattle, but for the human Species alfo; and are perlaps the only fubflitute that could be ufed for

Rins. bread with any probability of fuccefs. In the anfwer by Dr Tiffot to M. Linguet already mentioned, the former objcets to tlic conflant ufe of them as food; not becaufe they are pernicious to the budy, but becaufe they hurt the faculties of the mind. He owns, that thofe who eat maize, potatoes, or even millet, may grow tall and acquire a large fize; but doubts if any fuch ever produced a literary work of merit. It cues not, however, by any means appear, that the very ge.
neral ufe of potatoes in our own country has at all impaired either the health of bady or vigour of mind of its inlabitants. The queftion then, as they have already been flown to be an excellent foml for catth, comes to be merely with regard to the profit of cultivatine them; and this ferms already to be fo woll determined by innunerable experimeats, as well as by the gencral practice of the country, that no room appears Ifft for doubt. In the Tranfations of the Socieiy for the encouraganemt of Arts, a number of experi ments are related by Wir Yuans on that kind called the clufteral or bog putat, which he ftrongly recommends as food for the pror, in preference to the kidacy or other more expenfive kinds. The following is the refute of the melt remarkathe of his experiments.
10 the bill week of Murch 1780 , two acres am a quarter of barky fubble were fown with the ciuller potatce, which appeared on the 2 ad of May. A harp frott on the rth of Junc turnci them as black as they wfinally are by the frofts of November and Deiember. In time, however, they iceovered; and by the end of October produced $8 ; 6$ buhth from the $2 \frac{1}{5}$ acies ; which, when eleaned, were reduced to 780 , or 350 buflels per acre; thas affording, when valued only at Gd. per bufhel, a clear protit of 7 1. 14 s. 4 d. per acre. The experiment, how ever, in his pinion, would have been till nore profitable, had it not been for the fullowing circumftances. 1. The foin was nut altomether proper. 2. The crop was grievouny injured by the frolt already mentioned, which, in our authur's opinion, retarled the growth for about fix weeks 3. The dung was not of hisown railing, but purchafed; which canmot but be fuppofed to malie a great difference, not only on account of the price, bat likewife of the quality, as happened to be the cafe at prefent. He is of opinion, however, that putatues, at leatt this kind of them, are an exhauting crop. Having fown the fidd after this large crop of potatoes with wheat, his neighbours were of opinion that it would be too rank; but fo far was this from being the cafe, that the wheat thowed not the leall fign of luxuriance, nor the leait fuperiority over the parts adjacent which were fown without dung. He was willing to account for chis by the poverty of the durg, and the fevere cropping which the ground had undergone while in the poffition of the former tenant. In another experiment, however, in which the ground had been likewife exhauted by fevere cropping, the fucceeding crop of wheat howed no luxuriance; fo that the former fufpicion of the exhaulting quality of the clufter-potato was rather confirmed. The ground was a fine turnip loam; but though the produce was even greater than in the former cafe, viz. 356 bufhels from an acie, the profit was much lefs, viz. only 4 1. 15s. 6d. An acre of les. ground was fown at the fame time with the curniploam, but the produce from it was only 200 bunhels. Mr Young fuppofes that the produce would have been greater if the potatoes had been planted with an iton dibble, as the turf, in ploughing, lay too heavy upon the feed. A few rows of uther potatocs, planted alang with the clultered kind, did not vegctate at all ; which hows that the latter have a more powerful ve. getative faculty.

Having fucceeded fo well with his experiments on maph this kind of potato hitherto, Mr Younc determined to ma har
try fralc
tatoes. try the culture of them upon a larger feale; and there fore, in the year 1732 , fowed 11 acres: but being obliged to conmit the care of fowing them to an ignorant labourer, his makilfalnefo, thege:her with the exceffive cold and mollure of that fafon, fo dieninimed the pro. duce, that he had only a tingle acre out of the whole. This produced 180 bufhels, which yielded of clear protit 4 1.2\%.63. From this experiment he draws the following conclufions: 1. "That the poor loam, on which thefe potatoes were fown, will yild a crop of clutter-potatoes, though not of any other kind. z. That the manure for potatoes ought to be carted and fpread upon all foils inclinable to wet before the planting feafon, rither in autumn proceding, or dfe during a hard froll." In $\mathrm{t}_{7} 83$ he fucceeded ftill worfe; fur hanving that year fown three acres and a half, the protit did not exceeduis.4d. per acre. The prodnce was about $22+$ bumbelo per acre. He gives two reafons for the failure of this crop: 1. The clatlered-potatn thrives bedt in wet years; but the fummer of 1,83 was dry and hot. 2. The fering frott, by interrupting the hocing, not only greatly raited the expences, but very mach injured the crop by encouraging the growth of weed. Larley was fown after the lant crop, and produce: well: fo that our author thinks the potatoes feem to be a tetter preparation for fpring corn than wheat. His experiment in $1 ; 8+$ produced a clear profit of 21.05 .4 . ; the produce being 250 bullels per aere. Still, however, an error was commited, by cmploging an old man and woman to cut the lets; by whofe unfilfulnefs there were many great gaps amonig the potatoes as they came up; fothat, on the whote, On the whole, however, his opininn is fuvourable to the eluter potato. "With fmall crops (fays he), and at the low rate of value which is produced by confuming them at home, they are clearly proved to be a crop which will pay the expence of manmar, and wery ample tillage and hoeing. This is, afier all, the chief objcet of modern humbandy; for if a man can rely upon this potato for the winter confumption of his yard in fattening or kueping hogs, in feeding this horles, and fatecning this buillocks, he haj made one of the greatell acquifitions that can be defired; fince he can do all this ypon land much too liff and wet for turnips; houfes his crops before the winter rains come on ; and confequently without doing any of that injury to his land which the turnip culture is known to entail, and from which even cabbages are not free. Thofe who know the importance of winter-food on a iurnip farm, cannot but admit the magnitude of this object on wet fuils."

Mr Marfall, in his Rural Economy of Yorkfhire, has feveral very intereftang temarks on the potato. Its varicties, he fays, arc cndlefs and tramfitory. The rough -kinned Rufla potato, which was long a favourite of the Yorkfhire farmers, he is of opinion, is now no longer an exifence more than many others which floutifhed for a time. "There is fome reafon to belive (fays he) that the difeafe which has of late years teen fatal to the potato-crop in this and in other difluicts, uader the name of Curled tops, has arifen from too long a conticiance of declining varieties. Be this as it may, it appears to be an ellablifhed opinion sicic, that frof varishits, raifed froms feed, are not tiable
to that difeafe." Our author, however, does not look upon this to be a fact abfoluecly edabhed ; though one in!lance fell under his obfervation, ia which its removal was in al! probability owing to the introduction of new varictici. It made its appesance bethect 40 and 30 years ago, and fopead in fome degree ovar the whole kingdom. In fotie places it cor thated bus a thoot time, fo that its effets are ilmole forgnoten. It is leddom obvious at the firth coming up of the plant, but attacks them as they increafe in haze; the eatire top beeoming dwarth and firivelled as ifaficeted by drought or loaded with infect; : they weverticlef; live and increafe, though flowly, in fize: but the roots a re unproduétive. Some crops have heen almutt wholly dettroyed by this difeafe. In Yorkhire the Mueclands are in a namner free from it, but the Vaic is in fome 'meafure infected. Plants procured from the Minelanda remain free from it in the Vale the fortyear; lut, beines continaed, become liable to the difale. Where the atack has been pariail, weding out the difuafor planis as they failed, is faid to horve had a good elfect; and it is Caid the Morelanders got rid of the dilieale by this means.
 quainted with the meihod of raifing putatoes from rasing vas feed; which is as follows. "In autum, when the dictien from apples are beginning to fall ipoataneoufy, they are gathered by haad, and proferved anong fand until the Pring, when they are mafled ameng the fand or among fruth mould: feparatins the feeds and misuig them evenly with the muld. As foom as the fpini.g, frolts are judged to be ower, they are fown in fine garden mould; and as fut as he phans ges in:o rough leaf, and are thong encurg to te loudted withone injary, they are tranfinaned into anotice bed of rich mond in rows, which are kept clan duriag fummer. 1.a wo. tumn, bunches of fn:all puatotsace fousd at the roots of thefe platiss; vary ing in inze, the fort year from cia havelnat on that of a crab. Thefe beilg planted nocxi fpring, prodace putatues of the midde tize: bies they do not arrive at their fultat talk und the thits or fourth year. Where the ufe of the Hove ar the garden frame can be had, this proceis may be thortened. The feeds being fown within either of theie eariy in the fprity, the planos wall be lit to be pianted out as foon as the bouls are gence ly which means the fize of the roots will b: much increafed the lirtl ycar, and with in the ficomitife early to perfection."

In the 4 h : olume of the BathPapers, D: Inturfon Dr Aluare
 feed. The firt year they wert of difietut fives, from ramation a pigeon's egg to that of a frall pea. Onplanting thefencat year, it was invariably found, tha: tive largen potatoes yieided the langert crop; and the fane happesed the third, when a few inowed blutiom; but not evea thefe had bultus cqual to what wumb have been produced by very hare poiatoes. Whatec he concludes, that it is impolibie to afing istatime in which the fe feeding fotatus will i.rrive ai what is called forfeimer but that it mut depend very much on the watare of the foil a ad the colture bethownd up on them. Irom the practice ot the Korkinite futmers, howerer, and evell from the experiment: of tha

inferiur. The proft attencing the eultivation of them, however, appears to be mueb more do beffol than that of potatoes. Mr Artimer Young informs ins, that from Norden's Surveyor's Diablace piblified in 1000 , it ap. pears, that carrots were comnonly cultivated at that time about Oiford in Suifolk, and Norwich in Norfrik; and he remarks, that the tract of land between Orford, Woodbridge, and Saxmundam, has probably mare carrots in it than all the rell of the kingdum put Norfolk. together." In 1779 , few farmers in thefe pirts had lefis than five or fix acres; many from 10 to 20 ; and oneliad 3 6acres: th- Araight, handfome, and clean roots were fent at 6 d . per baflel to London; the rell being ufed at home, principally as food for horfes. In bther保 counties, he cbferves, the culture of earrots has not calturcha extended itfelf; that fome have begun to cultivate $\begin{gathered}\text { nit itfenf. }\end{gathered}$ them in place of turnips, but have foon defiled; fo that the cultute feems in a manner fill confined to the angle of Suffilk, where it frilt began. In attempting to inveligate the caufe of this yencral neglect, he obferves, that "the charge of cultivation is not fog great as is commonly imagined, when managed with an eye to an extentive eulture, and nat a conflined one for one or two particular objects." Two acres which our author had in cariots conl. $\mathrm{L}$. 3:17:6 per acre, including every expence; but had not the fummer been dey, he obferves, that his expences might have been much higher; and when he tried the experiment 15 years before, his expences, through inadvertence, ran much higher. His difficul'y tbis year arofe chiefly from the polyonum avic:alare, the predominant weed, which is fo tough that fearce:y any hoe can cut it. Some acres of turnips which he cultivated along with the carro:s were all eaten by the fly; but had they fucceeded, the expence of the crop would have been 18s. 5 d . lefs per aere than the carrots. "But (adds our author) if we call the fuperiority of expence 20 i . 2 n acre, I belicue we fhall be very neai the truth : and it muft at once be apparent that the expence of 20 s . fer acre cannot be the caufe of the culture fpreading fo little; for, to anfwer this expenie, there are favourable circumRances, which mut not be forgoten. 1. They (the carrots) are much more impenetrable to frolt, which frequently deltroys inferiorit) turnips. 2. They are not fubject to the diliempers and to turniph aceidents which frequently affect turnips; and they are fown at a feafon when they cannot be afeited by drought, which frequently alfo defroys turnips. 3. They lat to April, when fock, and cfpecially fheep-farmers are fo diltreffed, that they know not what refource to powide. 4. The culture requifite for turnips on a fandy ioil, in order to deflroy the areeds, deftroys alfo its teaacity, fo that the crop cannot thrive; but with carrots the cafe is otherwife.-Hence it appears, that the reaion why the culivation of carrots is till fo limited, dues not arite from the expence, but becaufe the value is not afertained. In plaecs where thefe roots can be fent to Liondon, or fold at a good priee, the tops being of afcertail ufed as food for catte, there is not the leall doubt that ing the va they are prefitable; and thercfore in fuch places they are ${ }^{\text {liue. }}$
generaliy cultivated: but from the experiments as yet laid before the public, a fatisfactory decifive knowledge of the value is not to be gained. The moft confiderable prastice, and the only one of conmon farmers upon a large feale, is that of the fands of Wowibridge: but here they have tie bencfit of a London mar.ti, as
rewts. already menfioned. Amongt thofe whofe experiments are publifhed, Mr Billinghey ranks foremon. Hereiagain the value of carrots is rather depreciated than advanced; for he raifed great crops, had repeated experience upon a large fcale of their excellence in fattening oxen and fheep; feeding cows, horfes, and hogs; and keeping ewes and lambs in a very fuperior manner, late in the fpring, after turnips were gone : but notwithlanding thefe great advantages, he gave the culture up; from which we may eonclude a deficiency in value. "In fevcral experiments(though notaltogether determinate), I found the value, upon an average of all applications, to be 13d a buffel, heaped meafure; eflimating which at 70 lb . weight, the ton is L. 1, 14 s ." "The following are the valuations of feveral gentlemen of the value of carrots in the way of fattening cattle:
Mr Mellifh of B!yth, a general valuation of perton. horfes, cows, atichogs, . L.
Mr Stovin of Duncatier, hogs bought lean, fat eed, and fuld off,
Mr Moody of Ra:furd, oxen fatted, and the account accurate,
Mr laylor of Bifrons, faving of hay and corn in feeding hurike,
Mr Le Grand of Afh, fattening wethers,
Sir John Hoby Mill of Biharm, fattening hogs,
Mr Billingney, for fattening hogs,

Some other gentlemen whom our author confulted, cuuld not rrake their carrots worth any thing: fin that, oa the whole, it appears a matter of the utmolt coubt, fo contradiatory are the accounts, whether the culture of carrots be seally attended with any protit or not. Thus Sir John Muli, by rattenin'r hogs, make: L. 1, 6s. and Mr Stovis L.. 4 ; but others could not fatten hoge upon them at all: and fome of Mr Young's neighbours told him, that carrots were good tor nuthii.g except to foour hogs to death. The experimetit of Mr Le Grand upon wethers appeared to be made with the greatell accuracy; yet two circomitances deem to milizate againg it. I. The fheep were put lean to them; whereas it is a fact will known, that if they are not half fat when put to turnips, no protit will refule; and it is poffible that the cafe may be the fame with carrots. 2. He gave them alfo as much fine hay as they would eat.

In this uncertain fate of the matior, the only thing that can be done is to nake a number of experiments with as much accuracy as fuflible, in uriser to afcertain the real valuc per ton: and our author endedvours to flow, that there is no danger of lofing much by experiments of this kind. "I have fhown (fays he), bat they are to be cultivated for L. 4 per acte, left on the ground for theep. Suppofe the crup only two banbels at 70 lb . each, per rod, 320 per acre, or ton tons; it will readily be agreed, that fuch a proance is very low to calculate upon, fince 20 tons ate cominon among carrot cultivators. It appears from Mr Le Crand's experiments, that a wother worth $\mathrm{L} .2,5 \mathrm{~s}$. eats 16 th . of carrots, and four pounds of lay fer day: dropping the hay, and calculating for theep of leis than lralf that fize (which are much mure common), it will be prollaps an ample allowance to affign them 12 lb . of c (remes a day. If they are, as they ought to be, half tat when
put up, they will be completely fattened in 100 Carrots
days. At this rate, 20 wethers will, in 100 days days. At this rate, 20 wethers will, in 100 days, tat 11 tons, or very little more than onc moderate acre. Nuw, let it be remembered, that it is a good acre of turuips which will fatten eight fuch wethers, the common Norfolk: calculation: from which it appears, that one acre of carrots are, for this purpofe, of mure value than two of turnips. - Further, let us luppofe horfes fee with them inflead of oats: to top, cart, and pack uf, 10 tuns of carrots, 1 know may be dome for 2cs.-an acre, therefore (other expences incluced) cults L.j. Fifty pounds weight of carrots are an ample allowance for a horfe a day: ten tons, at that rate, latt three horfea for five months. But this 1. 5 laid out in nats at 16s. fer quarter, will purchafe little more than fix quarters; which will latt three horfes, at two buthels each per week, no more than two months; a note enormuns inferiority to the carrots."

In the fame volume, p .187 . Mr Young gives an ac. count of another experiment male ty himfelf on the feeding of lambs with carrots. The quantities they eat varied exceffively at different times; thircy-fix of them conlumed from tive to ten buthels per day: but on an average, he rates them at foum buthels of $5^{6}$ pounds gee day. In all they comilumed $40-$ buthels from Nuvem. ber to April, when they were fold and killed fat. At putting upon the carrots, the lambs were valued only at L.a8, but were wild in April at I..25, 4s. ; fo that the value of the carioss was exactly L.,-+5 . or about 4 d. fer bumbl. This price he fuppofes to be foflicient to induce any one to attempr the cul:ure of carrots, as thus he would have a clear pront of fos. fer acre; "which (fays he) is geater than can attend the bett wheat crops in this kingdom." The land on which the carrots grew was fown next year with barley. atid procheed the clcanst in the parifin; which contradicts an aftertion our author lad heard, that carrota make land foul. The grats upon which the thetp were fed with the carrots, and which amouited to about an acte, was very little improved for the crop of hay in 1781, owing to the diynefs of the feafon ; but in $: 782$ was greatly fuperior to the relt of the field, and more improved in quantits: "for, inflead of an indifferens regetation, Icattered thick with the centanrea fabola, filago, rhinanthus, crifta galli, and lium catharticum, with other plants of litile value, it encouraged a very beastiful theet of the bet plants that can appear in a meadow, viz. the lathyrus pratentis, achillea millefolium, trifolium repens, trifolium ochroleucrum, trifolium alpetie, and the plantago lanceolata.
In the fane volome of the Eath Papers, P. 227, Mr Carrets Billing fley gives all account of the comparative prctit conpared of carrots and cabbages Of the former, ho..ever, he bayes. obsained only feven :ons 15 cwt . ferucere; the cablages produzed 36 tuns: neverthelef, according to him, the protit of the former was $\mathrm{L} .5,8 \mathrm{8}$.; of the lat:er, only 1. 3, 18s. In epaper on the culture of carruts by Mr Kirby of Spfuitin. vol. 3. P. 84. he iaforms us, that he never deternined the weight of an acte, but reckons the produce from 200 to 500 buhels; which, at $5^{5}$ lb. to the buthal, is from live to ten tous zod an haif. In the fanc vulume, p. 320 , the Rev. is: OnJey teenis to preier the culure of carrots to pota:0<
 greatrefs of produce to the peor, efpecially in all mall carcied to fouta I ionte, milefs near great towns, whether, on'a 1.roing pan, putates be to eligible as other herbage ": louss ; efpecially as carrots, which I cannot but furne (for my trials are too trivial to venture boder lan singin), deferse every encouragement, even un foils his. Whito thought too heavy for them,-l am from experince convine d, that an acre of earrots will doubic in the cqanum, of equaly hearty provender, the produet of an acte of oat: ; and fiom the nature of their vegetation, the rice monde of cu'tiation, and even of taking them the (all of which, copetive as they ane, bear a (x) inferiue proportion to the value of a medium crop), mat lave the land, eipecially if taken off it in an carly pertud, to mellow for the plough, as to form a feed bed in burler equat to any fallow tilth."
SIr Onley's cclideratum was a fuhtitute for oats to foed hoffer; of which great numbers are kept in his commy (Efiex). Putatoes, he obferves, are excelint for fon, th pork, when baked or boiled, mixed with a litele barlyy-meal; but for large hogs, they are moth profitably given raw, it thefe have at the fame time the thask of the bern door in thrething feafon, $\varepsilon \in c$. In the $\overline{\text { th }}$ volume he refumes the fubject, and acquaints us, that he applied a fingle acre in his bean field to the culture of carrots, which gererally produced too buthels; and this he conliders as a fmall protuce. " 1 am, however, fenlible (fays he) that they will amply repay every experce of the finctle calture; and hould, from tha ir exwhive utility on found, ceep, and friable land, be every where attemptel. Some of my neighbours, who have been induced to try them on rather a larger feate, with fimer cukure, and frether foil, have a ifed lrom 600 wheo bethels per acre, and applied them more profitabis, as will as more gemerally, than any other winter-
fonably thought to be altogeth.cr ccrtain; neverthetefs, Mr Youna, in the paper already quoted, informs us, that "turnips dunged for are univerlally a loling crop; for if they are Hated from 3os. to 40s. an acre, for if they are Hated from 30 . to 40 . an acre, ture gene.
the ir value does nut amount to the dung alone which rallyatend is fpread for potatoes; yet the latter pays that dung, all cd with other expences, and leaves a protit fometimes confider- "o profito able. I admit that turnips fed upon the land will prepare better for conn; but that is by no means the quef. tion. Would not the dung raifed in the farm yard by the confumption of the potatoes, fuppofing it fpread on the potato acre, make that pooduce more than the turnip one? I have no donbt but it would give a fuperi. ority. But turnips are liable to great failures, and cannut be relied on late in the fring; potatoes may; and are applicable to ufes to which the other root cannot be applicd." - In the fecond volume of the Bath Papers, p. 101. we have a comparative account of the value of tumips, turnip-rooted cabbare, and lucerne, as food for tattle. 'The refult of this writer's ubforvations is, that cathe. " when foeep are allowed as many turnips as they can eat (which fhould always be the cale when they are fattening), they will, on an average, eat near 20 pounds each in 24 hours.-An acre of turnipstwice hoed, will, if the land be good, produce about 50 tons; which will, on the above calculation, maintain 100 कheep 52 days. The fheep mentioned weigh 20 pounds per quar-ter.-An acre of turnip. rooted cabbage will maintain 100 theep for a month, and fometimes five weeks; but an atre of Scots calbayes will maintain 200 theep a full month." The number fed by lucerne is not determined.

The greatel difabvantage which attends a crop of The fig turnips, is thacir being fo ready to be damayed by the cationst fly, which fometimes deftroys them fo completely, that grear in. they nat be fown over again wo or three times the enee in fance Feifon, and wen this without any certainty of fuce nip culu cefs. Immunctable methots of avoiding this evil have been puajected, which may all be reduced to the followitge clafles: s. Stecping the feed in certain liquids. 2. Fuangation of the fides with the fmoke of certain herbs. 3. Rưling. 4. Strewing foot, lime, afhez, \&se. on the furface of the ground. It is very diffeult, however, to determine, with any degree of celtainty, whether remodies of this kind ate effectual or not ; becaufe fometimss the turnips are not injured though no precantion has been made ufe of: and when this happens to be the cafe, after the ufe of any fuppofed preventative, the plefervation of the crop is afcribed to the ufe of that preventative, whether it be really ©flicacious or not. The sirtues of fleeps feem to tave been fully wherk afectained by Mr Winter Charlon near Brillol, of flefisf whofe experiments an account is given in the Tranfactions of the Suciety for Encouraging Arts, vol. 5. The u feeds were of the Dutch kind, fowed on beds in the kitchen-gurdon in drills about 12 inches diflant, an inch and a haff deep, on the 1 th of May 1586. The beds had been prepared with rutten dung in May 1785, and aferwards fown with cabbages. The quality of the turnips is exhibied in the fullowing table; the bell being navked 1 ; and thofe of inferior quality, 2,3 , \&ac. The offervations were taken on the 2 Gth of June. Secal without any preparation,
ture; and without an exceffive degree of labour, as well
with elder and batton draining, foot being fowed over the covcred drills, with ditto, and lime fowed over the drills,
fowed with foot feattered over, and then covered,
with barton-draining,
an elder-bufh drawn over when the plants appeared,
with fate human urine, very few plants appeared,
with flackedhme fcattered over. and then covered, very few plants appeared, with elder, barton-draining, and nacked lime, very few plants appeared,
with lime and barton-draining did not vegetate.

Another fet of experinsents was made with the green Norfolk turnip, drilled an inch and an half deep, the rows one foot diflant, on beds eighe lect three inches long, and two feet wide; half a drachm of feed allowed for each bed, tteeped and mixed with various fublances like the former. The feeds were drilled upon unmanured ground on the 20th of June 1786, and the obfervation made on the 17 th of July. None of the beds were found free from the ravages of the fly; but the feeds which had been tleeped in train oil and lin. feed-oil were much more free from this injuy than the others. The linfeed-oil, as in the former experiment, was found inferior to the train-oil, which was fuppofed to have been owing to its being kept in a bottle that had formerly held oil of turpentine. The leaves of the fteeped feeds were of a much darker green than the others, appeared twice as thick in bulk and luxuriancy, and the plants were confiderably larger than thofe of the other kinds. The fubitances nixed with the reft were foaper's athes, wood-athes, pounded gun-powder, brimftone, flacked lime, foot, batton draining; fometimes mixed together in various proportions, and fometimes with the addition of a portion of fifted mould.
Thefe experiments thow, that no dependence can he had on fleeps or mixtures of any kind with the turnip. feed; though the train oil and linfeed-oll feem greatly to bave forwarded the vegetation of the plant. It does not appear that fumigation $\dagger$ has ever been tried; nor indeed does it feem eafy to be tried in fuch a manner as might enfure fuccels - In the fourth volume of the Bath Papers, Mr Gullet of Devonfhire gives fuch directions for performing the operation as he thinks would be productive of fuccefs. - In a preceding paper he had explained the good effects of fumigating orchards ; but the cafe with thefe mult be very confiderably different from a field of turnips. The trees in an orchard are elcyated above the ground, and the fimoke naturally afcends, and is blown along their tops: but in fumigating a large field of turnips, it mult creep along the ground in fuch a manner as is by no means agrecable to its na-

Vol. VIII. Part II.
as a vaft quantity of burning materiale, there cannot be the leat hope of fuccefs. Mr Gullet's directions are as follow: "If the turnip ground be fpaded and burat, or the weeds, \&c. burnt without (pading, the fumigation thereby may fuffice to chafe fuch of the winged tribe 3 from thence as are then there; but in all cafes, when the field is ploughed and ready for fossing, let heaps be made at different places and intervals round by the hedges and boundaries of the turnip.ground, and fome 3 few fcattered through the field; then, as foon as the 4 feed is fown, let the heaps on the windward lite and the feattered ones be lighted and kepe fmothering du4 ring the continuance of the wind in that quarter; the lefs the fire, and the more the fmoke, the betticr. Should the wind happen to fhift, thofe heaps on the quateer it fhifte to mult then be lighted and kept fmothering in like manner; fo that, during the growth of the tender turnip leaf, and until it becomes rouch and out of all danger, this fumigation and froke, over and actofs the field mull be continued from one quarter to the other; which, I venture to affert, will effectually deter and prevent any wingedinfeet tribe from approaching theturnipground; nay more, if chere already, it would moft completely drive them from thence, as fuch delicately formed infects (which can only feed on the moll tender leaf) would be ill able to continue long in fuch a fmother of fire and fmoke. The confequence is obvirus and certain, that if the fly be kept from approaching the field, the turnip-crup is fafe; and few, I beliese, will difagree with me, that prevention is better than remedy."

Our author does not fay that he has ever tried this method with turnips; but lays great ftrefs upon his fuccefs in a fimilar experiment with cahbages, in urderto preferve them from the caterpillar. To makethe mattermore fure, however, he recommends the trailing of a bufh of elder over the turnip field at the time of harrowing or brufhing in the feed: but this renedy has by numberlefs experiments been found infignificant, and by thufe above related feems even to be pernicions: fo that whatever good effects we can expect from this method, mult depend on the fumigation alone; and even this is attended with very great unecrtaintie3, as has alteady been ohferved.

Rolling promifes to be of fervice when the young of souing. iurnips are attacked by fnails, who frequently dettroy them; but it cannot be fuppufed to have much effect in deftroying fies, thefe being too numerous and too ininute to be effectually crutbed by the roller; and in. deed, though his has been frequently recommended, we have no decilive proofs of its having ever been attended with any good effect.
The llrewing of foot, lime, afhes, \&ec. upon the ground, have been determined ineffectual by the experinents already related, at leal when applied befure the turnips cone up; and there feems tu be little hope of their proving more effectual even when applied after the crep has appeared above-ground. We may arzue indeed a priori about the talle or fmell of foot, lime, Sce being diagrecable to infeets; but of this we have no pront: and even though this were the cate, the leaf fuon emerges from under this covering, or the intects will feed on the under part of the leaves, wheie the fe fublanees canmot lic. It is evident, therefore, thas very 5 B
litico
little can be erpeed from any of the methorl；hitherto propoc a dither by way of cure or prevention．The nure probable methends a．，

1．Fo low the tumips at hach a fuafon of the year
＂－9 ityy c．mones． cd． that they may be wall grown before the fly makes its appearatice．In the Bath Papers，vol．ov．p．132．Mir Wimpes obferves，that，in uider to procure food for their catte in the ipring before the grafs is grown，far－
mers are obliged to palp，ne the fowing of turnips be－ yond the natural time of vegetation；bat were harnips to be fowa in Aprit．as fom as the feafon would per－ mit，it in vely protahle that there world be as great a crop of them ats of oiher vextables utually fown in thefe month．On account of the delay in lo：ing，he ceer， for the reation already mentioned，the foceds of the far－ mer beomas aceedinety precarions，unlisithe is fofor－ tumate di to baice a few raing days，or clowdy weather and orequent haswer－，loon after the feed is foun：and this our abohor fupples to be the crue reafon why the turaip is a mere meertain articic than any other．But though lacentations of this kind bave a great thow of probsbilits，the is mot any cxperiment hithertu pub－ lifhet，cen by our anth rhandif，by which the truth of then ara lie aboundy afertained．Our author， howerer，i，of upinion，that mane the common me－ thods perpofed can antwer any zuod purpofe，farther than as h：mean，of them the vegetation of the plant may be inigenated．Mr Wimpey recommends athes， foot，or a rich comport of limate and tung，wed in tuth－ cien quatities：lut the methed of ofing them in etther to fow then wi：h the feed，or rather by themflues im－ mediately before，and wharrow them well in，that they may be completely incorporated with the foil．This for the moft part would fo invigorate and encourage the growth of the plan＇s，as to be an uvermatch for the mott vigorous attacks of the lly．

2．Another method propofed for fecuriny turnips will be more than fufficient for the comfumpt of the in． fects．This we find recommended in a teter to the Bath fociety by a genteman farmer in Effex vol．ii． p． 238 ．His method is to make the land clean and fine as foon as the feafon will permit，and so fow four pintsfer acre．It may be ubjected，that if the fly does not take then，the plants will Itand fo thick，that they cannot ealily be hoed；but this may be otviated by har－ rowing them tirf，which will make them fit for the hoe．There can be no expectation of a crop if the fy takes them when only a piat of feed is fown per acre； but this $\xi$ enteman remarks，that he has not in any one innnce mifed of a crop when he fowed four pines；be－ canfe，though the fly has fonetimes defroyed more than one half，and much damaged the other，itill there was a fufficient number left behind．He alfo agrees with other of the Suciety＇s correfpondents，that the greund fhuld be well dunged and manured previous to the fowing of turnips，as this makes them grow vigo－ rouny，in that they quickly get into the rough leaf，in
which tlate the fly will not touch then．

In the fame volume，a gentleman of Norfolk remarks， that manurng the ground in autumn for turnips is pre－ ferable to the choing fo in furing．This difcovery he made in conf quence of the following accident．－＂A neighbouring farmer，not having a fufficient quantity of manure for all his turnip land，was urder the neceffity
of fowing four acres unmanured．The effect was，that the turnips on the manured part of the land were mo＇lly eaten off be the fly，while four acres ummanured efcaped without injury．＂In conlequence of having obferved this，the gentleman made a finular experi－ ment，by manuring five acres well for turnip，and tulling three acres and an half in the ufual way without any manure．The manured crops wicre almull all deltroyed by the fly，$f_{0}$ that he was obliged to fow motl of the land over again．The three actes and an half which had no manure were entirely free from injary，though the plants were mach fmaller than thofe of the manu－ ree ground which came up．Not content with this trial，howere r ．he upated the experiment，by manu－ ring fix acres of wheat ilubble in autumn，ploughing it in mumediatch，and leaving it to ineorporate with the tarth during the winter：the turnips which grew upon this were as large as if the ground ha been manured in the fpring．This experiment was repeated with fur－ priting fuece is in two finceeding years；whence he in－ furs，that the Ry is either engendered in the new dung or enteced by it．But whin the manure is laid on in autume a lofes its noxious qualities，though it ftill re－ tans its nunitive ones．－This conclufion，however， does not appear to be well founded；for it is certain from undmbted expericnce，that turnips which have been well nanurad in the commoo way，have fome－ times efcaped any injury；while others，which have got no manure at all，have been almot totally deftroyed． Another material advantage，however，which this cor－ refpondent obferves is to be derived from manuring in autumn is，that all the feeds contained in the manure， and which are of courfe carnied on the land with it， vegetate almoit immediately，and are molly killed by the cold of the fucceeding winter，while the few that remain can fcarce efcape deftruction from the plough－ fhare．

Mr Wimpey is alfo of opinion，that it is proper to fow a large quantity of feed；but thinks two pounds will be fufficient for an acre．A few ounces indeed would be fufficient to ftock the land；but as the article is fo precations，he thinks it by far the fafeft way to al－ low feed in plenty，and reduce the plants afterwards by larrowing．He obferves alfo，that it is of great confequence to have feed both good in quality and of the betl fpecies．He prefers the large and green top－ ped，as being the moll fweet and juicy；others give the preference to the red or purple－topped，as being hardier：but at any rate，the feed from the largefl and finell tranfplanted turnips，of whatever fort，is greatly of the to be preferred，swen though it thould coft double or quality， treble the price．Such as is fold by the feedfmen in London he found genetally of a mixed kind，and often in great part not worth cultivating．＂Whether plants from new or old feed are moft fecure from the depre－ dations of the hy（fays he），is perhaps a queftion which cannot be eafily determined even by experiments；for concomicant circumftances are frequently fo much more operative and powerful，as to render the difference be－ tween them，if there be any，imperceptible．It is，how－ ever，known to every practical man，that new feed fprouts or vegetates feveral days before old；and I think more vigoroufly ：and it is equally well known， that the healthy and vigorous plants efcape the fly， when the linted and fickly feldom or never efcape them．
urnipe. It fhould feem then, that new feed, cateris paribus, is more fecure from the fly than old; and for my own ufe I would always prefer it."
3. The fowing of turnips along with other grain. This, of all others, feems to be the noft eligible and efficacious. In the fecond volume of Bath Papers, p. 210. an Hertfordhire correfpoadent gives an account of the fuccefs of an experiment of drilling turnips with wheat. A fmall field of fpring-wheat was drilled in rows two fect apart ; and in the month of May turnips were fown by hand in thie intervals. They came up very well, and were thinned once by the hoe. The crop of wheat turned out better than another field of the fame foil fown broadealt in autumn, though it ripened fomewhat later. The turnips were no other way injured by cutting it, than laving fome of the large leaves trodden down by the reapers. After harvelt the weeds were cut up round the turnips with a hand-hoe, and they grew very large and vigorous. They were of the purple and white long kind, and the crop proved nearly as good as the fame land produced in common. An excellent crop of barley and clover was got from the fame field afierwards.

1n the thid volume of the fame work we find an account of feveral fuccefsful experiments in fowing turnips between rows of beans. The advantages of this method are flrongly fet forth by R. P. Anderdon, Efiq; who made fome of the experiments, and are as follow: " I. You may have a crop of beans and turnips ou the fame field the fame year. z. The bean-crop being well horfe-hoed, no ploughing is wanted for turnips, for which the belt Norfolk farmers give five ploughings. 3. It is hoed cheaper, more effectually, and confequently more profitably, than in any other way. 4. The grouad is kept clean from weeds. 5. It is in order for a Lent crop the fucseeding year with one carth. 6. The ground is kept in heart, if not improved, by fallowing your alleys. 7. It brings the plant to perfection in poor ground, where it would not become fo atherwife. $\therefore$. It doubles the crop in any ground which Mr Anderdon has had experience of. 9. You have the cropss more within your own power in this than in any other method, let the feafons turn out as they will. 10. You may have on the fame ground a bean and turnip conp antually, if the land be fuitable, and you thin's proper. 11. The clay farmer, by this mode, renders land which is naturaly unfit for turnips, fo feer and open by feafonable horle hotings, that it will bring this nifful plant to great perfuction."

On this papet the rociety made fome remarks, and Bath flated the forlowing objections: t. 'lle fame foil cannot be proper for butin crups. Sutch cabbages are more adapted for a bean frill ; and they winhed him to repeat the experiment with cobbarges inftead of tumips betwixt his beans. 2. The Nunfolk farmers rately ufe nore than thee ploughings for turnipi, inllewh of five, as Mr Anderdon 1eprefents, wrile fs the gromed be full of eouch grafs. 3. They $t^{\text {t ink }}$ him too fangunc in his expeciations of having doulde crops on the lame field. 4. Nothing renders a clay foil fo free and upen
as to have it expofed to frons and fnow by being laid up in high ridges in January and Fetruary ; but, on Mr Anderdon's plan, this cannot be d.ane, unlefs the turnips are leffened in value by being fed off in autumn.

Thefeftrictures were fent to Mr Anderdon before Mi Ander. the papers were primted, but did not make any altera-dan's reply. tion in his opinion; and he replied to the following purpale:

1. The fame foil cannot be proper for beans and furnios, Esc.-Grantecl. - Buat had Mr Anderdon adhered rigoroufly to this rule, he would have fowed no turnips at all, not having on hif farm any foil altogether proper for that crop: "but (fays he) while I can get in fingle rows, four feet afunder or more, from half a dozen to half a fcore ions of turnips per acre, after, or rather between, a crop of beans in my heavs lands, I hall feel that product here more benchecial than to drop the mode, I belicse the meclium of the two, fo far as I can judge by the eye or get infurmation, to be fuperior to the average probluce of prepared fallow turnip crops in 10 miles round me." - On this the Society make the following remark: "The quettion here is, Whether, if inlleadof turnips, Mr Anderdonthad plaseed his beans two feet ditant oniy, the extra produce of his crop would not have exceeded in value that of his turnips? We think they woukl, as there intervals would freely admic his horfe boe between the beans."

Mr Anderdon then proceeds to acquaint the committee, that he had tried the experiment as they wifh. ed with Scotch cabbages inftead of turnips betwixt the rows of beans; hut the crop of the turnips was fo much preferable, that he found himfelf inclined to fuppofe the cabbage would not get to fo great perfection there as to be profitably introduced on a large fcale, for want of the great quantity of dung neceflary for that crop, and which could not be procured in that part of the country. He further remarks in favour of turnips, that they have an abundance of very fmall lateral fibrou; roots, which run fo far in fearch of food, and feed as ravenoully where they can penetrate, as thofe of almolt any other vegetable; and the plant certainly derives more nourinanent from thofe than from its tap-root (1). Thofe fine fibrous rout, almort imperceptible to the eyc, iffue chie Ay from the apple or body of the curnip, and get into the rich:ll part of the foil ncar the furface, and will briug the phanes to a combleable magninuec in heavy lands atapted to beas, when mellowed by the horfe-hoe. Same of his turnips weinhed ten pounds each : and if he could have only two fuch twinips on every !quare yard, it would be at the rate of +3 tons $p=r$ acre.
2. The Commitise doubt of the pastibiting of doubing the crop. Mr Anserdongives the following explanation. "I have made many comparative trials on thruips between this mode and broad calt fowing, and always found nat my ground the herk wod ciops the bette: Bur hets, in denestag the t accht. Wh the th we-hoe by it doublitur a crop, I with to be underllound, that if, in foils like mine, a crop be dithed, leaving proper in5 Bz
tervals
(A) Here the Society remark, that this is not the cafe with thofe kinds of rurnips which grosy chisfly above ground, and which are generally the beft crops, and molt capable of refiling the frotts.
tervals for horfe hoeing, and one part be horfe-hoed the other not, the horfehoed part will double the other in prodact."

Mr $\lambda$ nderdon, in the coutfe of his reply to the commitee, gives an aceount of another cxperiment he made in conkanence of being defieient in winter fodder for his cattlo. By this neceflity $l_{1}$ e was induced to fow turnips wherever he could; and on the 18 th of July dritled a fingle row between his drilled wheat. On the 2oth and 22d of Auguit he drilled four rows of winter vetclues in each interval between the turmips, at the rate of lefs than one peck and three quarters of feed to an acre. "The turnip crop (fays he) is very acceptable, and my vetches fucceed beyond my warmelt expectrion; are thick enough, and give me the platine profpect and hope, that I fall wot, when my dry mut is gonc, want a fafonable fupply of early green Codder that will latt me till my lacetne comes on."
8. Mr , i=r's ufis.iun.

This fubjest if futher conidered in the fame volume by Mr Pavier, who viewed Mr Anderdon's turnips, and gate in a report of them to the committee. Fle fuppofes a crop of beans drilled in lingle rows at four feet dithance, and the turmips drilled in the intervals, accoiding to Mr Anderdin's metnon, there will then be four rows of: 7 feet in length to make a fquire perch; whentas Mr Anderdon's row were only 15 fect 8 incies in longtio and this difparity in lengeth will make a difference of weight on a perch from 230 to 249 pernds, and on an acre fiom I 6 tons 8 cwt. 2 qrs. 8 lb . Mr. Anderdou's produce, to 17 tons 15 cwt. 2 gri. $2+\mathrm{lb}$. - Each turnipat this ditance (viz. four feet from row to row, and nine inches in the rows) muth occupy a fpace of three fquare feet ; confequently the greatell number produced on an acre mult be 14,520; butif fown in broadeal, twice hoed, and the diftance on an areacere 15 inches, cach turnip will then cocupy little more than one foot and an half. and the number produced on an acre may be abont 27,920; an excefis which may reafonably be fuppofed to overbafance the value of the beans, lit ue fuppofe the crop as great as we can reafonably do. Thus far the argument feems to lie arainl this method of cultivating beansand turnips together: but on the other hand, Mr Pavier confiders it probable that the expence of drilliag and horfe hoeing the beans, together with drithing the \&uraips ir the manrer Mr Anderdon did, mut be confideratly leis than that of fall wing and preparing the ground, and fowing the turnips in broad-catk; to which we mult likewife add the fucility of hoeing the drill; in comparifon of the broad catt. But befudes thefe, the great adoantage ariling from this method, and wheh, if certain, gives it a decided fuperionity, is, "she grear chance, if not an almott eertanty, of prefervint the tumips from the depredations of the tly." MI Pivier was inclined to think that this mult be the cate, a $\$ 1$ Anderdon hay? fuch crop, repeatelly withont any camage of that kind: but the committe dille from him, and think that this mult have procecded from fone other caule; thoush they bo nut alfi?n aty reafon for this opilion. "the principal print (fays Mr lowier), in determining this queflin, foms to me to be this: if the crop of beano drilied as :hase, after dahueting the feed, athed fome additional expmee i!t taking the crop of the gronme whinat ij jong the tanap, can be, one year
with another, fuppofed to be as valuable as the quantity of turnips that might be reafonably expected in the broad-call method more than in the other, I fhould not hefitate to diclare in favour of drilling between the beana."

Thaus far the argument feems to be carried on $\dot{a}$ friori. Mr Wimpey, in the letter already quoted, inclines to the practice of fowing turnips between beans planted in rows. "It exacily correfponds (fays he) with all my obfervations on the fuccefsful vegetation of that root. A confideratile degres of moiture is neceflary to the rapid vegctati in of that very juicy loot, and nothing retains amithure equal to lhade; and fade ean be obtained and fecured by no means fo effectually on a large foale as in the intervals of tall growing plante, as beans or wheat planted in drills." 'The fuceds of Mr Lalt of Kingtlon near 'Tauton, laves little room to doubt of the propriety of the method, and its fuccels in preventing the tly. The beans were planted in drills not quite two feet afunder, on two plowings, horfe-lood three times, and the turnips fown in the intervals at the latt hoeing. The tield meafured tix acres and a quarter, and was a very grond clayey foil, but had not been manured, nor had any dreffing laid upon it for fix years befure. It produced this year three quarters of beans per acre, and 37 tons 5 cwt. of turnips. This field was alfo viewed by Mr Pavier, who makes the following obfervations upon it. 1. The turnips were fown promifcuoully anoong the beans at the lalt hoeing, which was given abuut midfummer; from which time nothing was done but drawing off the beaus and carrying them off the land. 2. The crop of beans was betived to be confiderably above 20 buflels per acre, which is manch more than were producal by any wher method that featon in the neizhburing part of the conntry: and as Mr Pavier had this accomint befire he faw the turnip erep, be did not expect any thing confiderable from the latter ; but as it turned out, the prodnce mult be accounted highly profitable, when we confider that there was no crop lul, no prepatation, deffing, nor any expence whatever, excepting the price of the feed and fouing it. 4. This he cunfiders as one of the Arongeft iecommentations of the drill hufbandry he ever knew on heard of; but he is of opinion that it never can anfwer exeept where the ground is perfectly clean and free from weeds, by the crops laving been horfe-hoed for a few years before. 5. He thinks the beans ought to have been planted at wider inteivals, by which the fun and air would be freely admitted, and the plants would alfo be lefs damaged by the operation of the lace.
Mr Pavier likewifl informs the Society of two other Other $9^{\circ}$ experiments on a fimilar plan; but with this difference, perme that the turnips were fows among the beans at the fe- on fows cond horfe-hoeing. The turnip crops were very good, turnips and the beans more than doulle the value of thofe rai-beans. feed in the ufual mode of dubandry. "I think it is very evident (fays lex), that the beans preferve the turnips from the fy; and as no expence or trouble attends the pradice, I apprehend it will foon become more general." 'Ihe Socicty own, that the nacom non fuccefs of Mr Bult's taperinuent ferms to milhate at leate again't what they faid on Mr Anderdon's letter; but acy infit that the calcs are by no means timitar. "Thenigh the latd (fay they), in both intances, ia called a beaqy
urnips. clay, they are very different. Mr Anderdon's is poor, wet, and cold; the other a good rich clay; and we apprehend naturally mixed with a kind of marle, which is called clay by perfons not thoroughly acquainted with the nice diftinction of foils a;parently alike, but very difercnt in their nature. Our principle therefore, that cole wet clay lands are unfuitable for turnips, remains unaffected by this experiment: and general practice confirms the truth of the theory."

In another letter, Mr Pavier gives a more particular account of the two other crops of beans and turnips raifed upon Mr Bult's plan. The beans were dilited in rows about 22 inches ditance, twice borfe-hoed, and the produce from ahout $2 ;$ to 30 buthels the computed acre, or from 30 to 36 buthels the itatute acre. The preceding fummer had been very unfavourable to beans, and the produce per acre in the cummon hubbandry did not, on an average, equal a third part of this quantity. One of thefe crops was fuperior to that of Mr Bult: they were fown upon a field of nine computed acres on the scth of Junc, after the fecond horfe-hoeing; but whether the focund tweing was performed too foon, the ground no: clean, or whatever might be the caufe, the heans were weeded twice by hand afterwards; and he is of ofinion, that the turnips were fomewhat bentited by it. Mr Pavier was affured by a very int llifent farmer, that this was the beft crop of turnips he hal ever feen. The turnip-feed in the other crop was put in between the rows of beans by a hand drill: bus the work was lasly peaformed, the plants coming up in forme places vally ton thick, and in others a nouch too thin; but wherever they happened to be of a proper thicknefs, the farmer told him it was one of the nuett profitable crops he ever had. The foil was wet. ludy, and not very faw urable for turnins. Flence Mr Parier dedaces the following conclufions. I. 'llat with refpeê to beans in patticular, the drillige and lorf hoeing is ve fly fuperior to the common mode (f) hubandry. 2. That the beans are und whtedly a good prefervative of the turnips from the depredations of the fly. 3 That as by this micthod no crop, is loph, and corfiquatly ron rent, bus a mare trife of expenct (if any) chargrable to the cur. nip crop, it mull be one of the molt profitabie as well as the moft certain method of propagating that ufful root ever yet practifed. - He dill infitts, however, that if he had an opportunity of trying this method, he would drill the beans in rows at a greater diflance, that the turnips mught be katid hood eafily; and that he fhould fufer the London tick-bean to any the:, by reafon of their thorenefs and being fuch bearcte; that he fhould alfo take off their tops as foon as the tinder bloffoms began to decay; which, he fuppeftes, would be of great fervice.

We fall clofe this differtation on the wes and culture of turnips with an account of an iufrument wied in Norfolk for tranfplanting him, and thas tilling up the gaps which frequently happen in field foom the failure of the planis in particular fpots. It is repre. ferted on the margin; and the corfiturution and in we of ufing is obvious from the Egure. - Wher, the turrips are to be tranfplanted, the worknian holds the long handle with the left hand, and the thort sue with the right hand draws ap. Put the inthuntent thas
over the plant that is to be taken up, and with your Turuips. foot force it into the ground; then give it a iwitl round, and by drawing it gently up, the eartly will adhere to the ronts of the plant in a folid body: then with another inftrument of the fame fize take the eareh out where the plant is to be put, ard bringin? the inflrument with the plant in it, put it into the hole which has been made by the other; then keep your right hand Atcady, and draw up your left, and the earth and plant will be left in the hole with the roots undiflurbed. In this operation two neen mult be employed, cach of them having an influment of the form reprefented on the margin. One man takeo up a plant while the ather tills his inllruncnt with carth on'y, thereby making room for the deprotion of the plat; fo that the hole which is made by taking up the plant is filled with the carih taken out where the plant is to be put; which being depofited, he takes up a platit, and returns to the place he firlf fet out from, the former man at the faine time returning with the earth only ; fo that each man is alternately the planter, and each being employed both ways, the work gives oas brikly:- This iatrument was the invention of Mr Cubitt Gray of S.unthrepps, Norfolk.

Turnips being the grand balis of the Nurfulk hufbandry, Mr Marhall gives a very particular account of their culture in that county. - The fpecics cultisated are, 1. The common white flock, called in many places the Norfolk turnip. 2. The purple fick is fiain lar to the former, but its rind is of a dark oed or purple colour: its fize in general fmaller, and its texture sorfors clufer and firmer than that of the common whise-dtoch; whevaton it alfo Itands the winter better, and is more fucculent ": turnips. in the fpring, but it is not for well relifhed by catele as the former; whence it is lefs generally cultivated. 3. The pudting glock, the tankard lurnip of the Madland counties, is in thape fo peofectly diferent fum the common fort, that it might be rauked ds a dillact ipecies. It rifes in a cylindtical furn, cight. ten, or twelve inches high; flanding in a manner whomy above ground, gencrally taking a rough itregular outhoe, and a fomewhat reclimisg poture. If wety much ore fembles the common turnip, and is by much its mont formidable rival. It many refpects it feems to be fuperior, particularly in being rea hily dawn, and eaten off by fheep with much lefo waite than the common turnip. - The difadvantage is, that they are liable to the attacks of frof, by reafor of their Ranling fo high above the furface of the ground; fo that un the whole, Mr Mir?h.ll conclukes, that the common whece turnip is to be perferred to cwery other.

In Noriolk, turnips are fown upon cerey fpecies of ${ }^{23}$ arable land. Marl is found to be herhy beneticial; blumage and by meane of this manare, a ful nawally unlit marl. ${ }^{5}$ for turnips may be rend red praper fon it. They fioeceed barky ather than any wher crop; fome fow ane fown on wheat or pea nubble sfter harvetl ; Lut this is not a general p:actice. The manures in greutull is ares reputution for turnips are dung, wih a grater or we diterse imaller edmixture of motd ; iadt coumbs atc alfs in kmos. good repuse, and rib-cahe is ufed by a few indivicuals: - bur it may be faid, that nine astes of tea of the turniss grown in ealt Nonfolk are mamured wh inwk. "- The quantity of sung fot on for a crop of

$\xrightarrow{(1)}$

and the quantity of turnipground to be manured From to to 15 catt-londs of munk are coniflered as a good defling ; and about a ton of oil cake to three actes; 50 or 60 tuthels of malt coombs, and to or [0.7 50 humets of foot, to an acre.
Cubivation When the tumips are intunded for early confumpof eurnizn tiun, the fooner they can be got into the ground the for early comiump. tion.

better; but when they are intended to thand the win. ter, the beginning of July is thought fion enough. The mon sencrai ruie is io begin liwing about a week before mid firnomer, and continne till shout a fortnipht efter, $t:$. from the 1 th or 1 sth of $J$ une to the the or Shof Jul. - Brons calf fowing isuniverial, in the quantity of two pints to an aere. The feed is covered by two lincs of a pait of liwht harrows diawn baek ward, in order to prewent the hues, which afually point fomethin formart, from teaning up the olods, and burying the feed tho itep. 'The honles are univerfilly walled one way, and troted back again in the fane place. This is an cxcellent cultom; the quick ris-\%ag motion of the harrows at once affiling to levd the furface, and to ditribute the feeds more evenly. - They are univerfally hoed; and unlefs they be fown very late, are gencrally hoed twice. The ditance of time betwect the fowing and the firt hocing depends upon the foil and feafon; the bize of the plants being the only guide. When turnips are fuffered to grow too Iarge before they are hoed, the plants are difficule to be fet out lingly, and are liable to be drawn up by weeds, therchy acquining a fender upight tendency; whereas their natural growth, in their infant Hate, is procumbent, fpreading their fift leaves on the ground, and taking the form of a rofe. If the hoe be put in too foon, the plants which are fet cut are liable to be buried, and their tender roots difturbed in the act of fetting out the neighbouring plants. The time for hocing, as directed by the moll judicious hufbandmen, is when the plants, as they lie fpread upon the gromud, are about the lize of the palm of the hand: if, however, feed-weeds be numerous and luxuriant, they ought to be checked before the turnips anive at that fizze, left by being drawn up tall and flender they fhould acquire a weak and fickly habit. The proper diftance depends upnn the nature of the foil and the time of fowing ; luch as are fown eally, in a rich productive foil, require to he fet cut wider than thofe fown late on a foil of a contrary nature. If the forl be at par, the diftance ought to be regulated by the time of fowing: if this be at par, the nature or tlate of the fonl flould be the regulator- Ma Mafloll comFhains of the cotoduct of the Norfolk tarmers in general in this refpe:t, who "hack out their turnips 14, 15, or perhaps is inches afinder, withont any regitl to the tate of the find, or time of fowing. This practiee was cftablihed white the Norfolk fon was full of manl, and new to turnips; and when, it is probable, 11 or 12 inches in diameter was no uncommon fize, with tops proportionally large and fprealing; and 14 or 15 inches might then be a proper difance. But now, when the eflicacy of marl is lefiened, and the foil mo longer the favourite of turnips, which foldom reach more than feven or cirht inches in diameter, it is ruinous and abfurd to continue the practice."

Turnips are cultivated either for feed, for fale, or for confumption. When cultivated for feed, it is fup-
pofed in molt parts of the kingdom that it nught al. ways to be taken from traniplanted routs; but in Nor. folk they are frequently raifed from fuch as are untranf. planted. "It is a fact (fays Mr Marfhall) well un- Cutivazio derflood by every hubmendinan here, that if the feed be of curnips gathered repeatedly from untramiplanted roots, the for fect. plants from this leed will become coarte-necked and toul-rooted; and the flef of the root ittelf will become ricid and impalatable. On the contrary, it it be gathered year after year from tranflanted roots, the necks will become too fine. and the fibres too few; the entire plant aequiring a weak delicate labit, and the produce, though fiveet, will be fmall. For the neek, or onfet of the leaves, bing reduced to the fize of the finger (for inflance), the number and lize of the leaves will be reduced in proportion; and in a fimilar proportion will the number an.t fize of the fibrils be reduces. From a parity of reafoning, it may perhaps be inferrad, that when the neck acquires a thocknefs eq ral to that of the wrilt, the fize of the root will be in proportion.
"With refpeat to the fibres or rootlings, this is a jult inference; but with refpect to the bulb, it is in a great meature erroneous. Fur a few generations the fize of the bulb will keep pace with the increale of leaves and tibres; but after having once reached the limits which nature has fet to its magnitude, it begins to revert to its original fate of wildnefs, from which to its prefent flate it has undoubtedly been raifed by traniplantation. The farmer has therefore two extremes to avoid. The one is difcoverable by the thicknefs and coarlenefs of the neck, the fealy roughnefs of the bult, the thicknefs of the rind in gereral, the foulnefs of its bottom, and the forkednefs of its main or tap-root: the other, by the flendernelis of the neek, the finenefs of the leaf, and the delieacy of the root. The former ane unpalatable to cattle, and are therefore creative of walle: the later are unproductive, are difficult to be drawn, and do not throw out fuch ample tops in the fpring, as do thofe which are, by conilitution or habrt, in a middle fate beiween thefe two extremes. There is not, however, any general rule refpecting how many years turnips ought to be tranfplanted fucceflively, and how often they ourht to be fuffered to run up from the feed-bed : the foil and fituation have, and other circumftances may lave, influence on the habit and contitution of vegetables as of animals; and the farmer muth attend alone to the thate of the turnips themfelves. Whenever lie judges, that, by repeated tranfplantation, they have paffed the acme of pertection. then it is lis duty and interen to let them tun up to fetd withont tran!planation. In Norfolk it has been found, by long experience, that tranflanting twe, thece, or four vears, and letting the plants run up the third, fomst, or fifh, will keep the ilock in the defired itate. The tme oi tramplanting is from O:U Chrihmas to Ohd Candeman. In the choice of plats, the farmer is mot thilded by fore, but picks the cleancl plants without mended to lize; or, more accurately (peakiny, he makes hoice if fuck as are near. but not at or atbes, the Hate of feffection In almoll every turnioftich there are plants in various flates: much judgment, therefore, is requifice in the choice of plats. A Diece of good Method ground near a habitation is qeneraily cisofen for this plantiog. purpofe; but the method of planting is various: the
plants are generally, fet in rows, at uncertain diftances off their tops with a fpade, he gave them to his cows, from one another." Thefe diltances our author has abferved to be 16 or 18 inclies, and the difance of the plans in them nine or ten inches; but the practice of a man who, he tells us, is indifputably near the head of his profeffion, is to plant them in rows two feet afunder, the plants in the rows being contiguous. The rnive cultore acquired, is to keep the intervals clean hed: but when the feed begins to ripen, much care is requ fite to keep it from birds. If the plot belarge, it is neeeflery to employ a boy to feare them; but if it be fmall, and near the houfe, Mr Marfhall has known nender polt, riling in the midit of the pateh of feed, was fixed a bell; from which a line paffed into the kitchen : in the mot frequented part of this hong the pull. Whosever paffed the pull, rung the bell; fo that, in a farm honfe kitchen, where a miltrefs and two or three maids were fome of them alnout always on the font, an inceffant peal was kept up; and the birds, having no refpite from alarms, forfook their prey."

The time of drawing commences about Michielmas, and continues until the plants be in blow. 'The procefs of drawine, lie fays, "in fevere weather, is an employment which nothing but cuftom could reconcile to thofe whofe lot it is to go through it, namely, flout lads and youths; whofe hands are frequently fuelled until the joints are difcernible only by the dimples they form ;" ncverthelefs he never heard of any inflance of bad effects from this circumllance. When the tops will bear it, their methud of pulline is very expedutious: they pull witls both hands at once; and having filled each hand, they bring the two together with a fmart blow to difengage the foil from the roots, and with the fame motion throw them into the cart If the tops be cut off by the frolt, or if this be in the gromen, the turnips are raifed with two tined forks named crooms. If the roots are buried under deep frow, it is removed by means of an implement called the fnosu. gedge. This conlilts of three deal-hoards from one to two inches thick, 10 or 12 inches deep, and from feven to nine feet long, fet upon their edges in the form of an equilatcral triangle, and itrongly united with nails or itraps of iron at the angles; at one of which is fattened, by means of a double Mrap, a hook or an cye, to falten the horfes to. This being drawn over a piece of turnips covered with fnow, forces up the latier into a ridge on cach lide, while between the ridges a Atripe of turnips is left bare, without having received any material injury from the operation. 'rhough it is cullomary, in draving, 20 clear the ground cutirely, our author met with one inflance in which the fmall ones were left by a very good hulbandman on the ground, both to increafe in lize, and to throw out tops in the fpring ; it being obfervable, that a fnall turnip fends up a top neaily equal to one whofe bulb is larger. There is one inconvenience, bowever, arifing from this practice, the plonsll is prevented from entering upon the foil until late in the fpring; which, upon fome foils, is an unfurmountable objection; tho' it may be very proper upon land which will bring good barley with one ploughing after turnips.

Mr Marhall relases the following limple method, by which a Norfolk farmer preferved turips through a confiderable part of the winter feafon. Hawing cut
and carried the bulbs to a new-made ditch, into which he threw them, and then covered them up with Araw, laying over it a quantity of hranble kids. Here they lay until wanted in a frof. Thev were then arain carted by means of a fork. and given :o the cattle, who eat them as well, or rather betier than frefh diawn turnips; and in kelleral they came ou: as frefl as lley went in. Our author is uf opiuton, that this method might be extended to the prefervation of turnips till the fpring.

## Sect. VIII. Turnip-rcoted Gabbage.

Turs plant may defervedly lie reckoned next in value ateanea to the turnip itelf. Jes advantanes, acconding to Sir atconang Thomas [Beevor, are, that it afords food for catele the cultivalate in the ppring, and rechits mikew and froll, which toon of this fometimes detroy the common turnip; whence he is tout. of opinion that every famer who cultivates the comamonturnip thomd always have part of his farm laid out in the cultivation of this rout Fur his mode of culture, Sec. Sec AGRICULTURE, $n^{\circ} 170$; and under $n^{\circ} 173$ of the fame article is given an account of Mr Robins's method of raiing thein In another letter from Sir 'Thonas Beevor, Dath Papers, vol. iii. p. \& 9 . he expreffes his hope that the rurnig-routed cabbages he had weuld latt until he fhould have plenty of grats for all his llack. To make a comparative eltimation of the quantity of fond yielded by the turnip-ronoted cabbage and the common turnip, he felected fome of yuat the of each kind, and having girted thein with as much ac. fees m thas curacy as poffible, he found, that a turnip-rooied cab. athed the the bage of is inches circumference weighed $55^{\prime} \mathrm{lb}$ and curnip. a common turnip of the fame lize only $3^{\frac{1}{2}} \mathrm{lb}$; on trying lurnip. ohere, the eeneral refule was foum tu be in that proportion. Had they been weighed with the tups, the fuperiority of the turnip-rooted cabbage would have beengreater, the tops of them being remarkably buthy. They were weighed in the month of March; but had this been done at Chrittmas, our author is of opinion that the difference would not have been log great; tho he reckons this very circumblance of their comtinuing fo lonis to aflurd a nourifing frod, an intlance of their excellency above almoll every other vegetable whatever.

In the fourth volume of the farme work, Sir Tho Other c:mas gives an accourt of another experiment on fiveporancu?s. acres of turnip-rooted cabbage, four of which were eaten upon the fistd. the other was pulled up and carried to the thatles and ox-houles. They were fown and coltivated as other turnips; the beafts were put to them on the 12 th of April, and continued feeding upon them till the tith of May. The catte fed for this fpace of time were, 12 Scotch bullocks weighing to tone each; eight homelieds, two years old ; hifteen cows full-lized; to theep; 18 horfes; belie's to flore hogs and pigs, which lived upon the broken pieces and offal without any other allowance for the whole four weeks. The whole walue of the plant; cxclufive of the feeding of the pigs, amounted, according to) our author's calculation, to L. 18; and lie fays that the farmers would willingly give this fum in the fpring for feeding as many cattle; "becaufe it enables the to fave the young fhooting grafs (which is fo frequent),

## tion of the

 plantinjured by the tread of the castle in the frotty nights) until it gets to fuch a length and thicknefs as to be afterwars's but litele affected by the fummer's drought. Betides this, the tops or leaves are in the fpring much more abundant, and nuch better food than thofe of the common turnip, as already oblerved; and they con tinue in full perfection after all the common turnips are rotten or worthlets.

The difadvautages attending the cultivation of turnip rooted cabbages are, that they require a great deal of time and pains to take them up out of the ground, if they are to be carried oft the field; and if fed where they grow, it requires almolt an equal labour to take up the pieces left by the catle. A great deal of earth is alfo taken up along with the root; and the fuhftance of the latter is fofirm and folid, that they mute be cut in two in order to enable the cattle to eat them. To obviate fome of thele ubjections, it will be proper to fow the plants on rich and very light land; and as they arc longer in coming to the hoe than the common turnip, it will be froper to fow them about the beginning of June.

## ifro. every

 farmer ousht en cu rivite this plant.In annther experiment upon this plant by the fame gentleman, the cabbazes held out during the long and fevete frof of 1788 without the lealt injury, though it dellrosed three fouth of atl the common turnips in the ntialibourhood. On the 2 ! It of April 1789 , the averape produce of an acre was found to be fomewhat more than $24^{\frac{7}{2}}$ tons, though the tops had nut furout. ed abore thee inches. Confidering the precarioufnefs of turnips and other crops, Sir Thumas is decilively of opinion, that all farmers ought to have as many turnip. rooted cabbages as rould affurd and enfure them a full provifion for their cattle for about three or four weeks during the latter part of the fpring. This quantity he reckons fufficient, as the confumption, particularly when drawn and carried off the land, is attended with nore trouble and expence than that of common turnips, efpecially if the foil be wet and heavy. In another letter, dated May 3. 1790, Sir Thomas Beevor once more fet forth the advantages of having a crop of thefe vegetables during the fring-feafon. "In confequence (fays he) of the very cold weather we have had here, the grafs is but jut ipringing: as the turnips are wholly caten up, it occafions much dittrefs among the farmers for want of fome green vesetable food for their fheep and catde; wheteas, by the afftlance of my turnip. rooted cabhages, 1 have abundance of the beft and moft nutritive food that can be found them." He then proceeds to recommend their culture "for the fupport of almolt all live Huck for the three laft weeks of April, or tirft week of May, when the grafs thoots late."

In the fth volume of the Tranfactions of the Society for encuuraging Arts, Mr Robins, who received a premium for rafing the greatelt quantity of this plant, informs us, that the foil on which it grew was a fone braif, inclining to fand, not worth nore than 10s. per acte; the preparation the fame as for turnips. The manure was a conpolt of earth and dung, which he finds to anfwer betitr than dung. The feed was Eown about the beginuing of Apsil on a clean fpot of ground; and he commonly ufts an old pailure whore the theep. fold has been in the winter, after taking away the dung, and digging it wer: flallow; "as the roots $x=59$.
of the young plants fays he) might foon reach the dung or falts, which mutt confequently be left, in order to force them out of the fly's way." Thefe in. fects, our author ohferves, are extremely fond of the turn:p-rooted cabbage; much more fo, he believes, than of common turnips. sbout the middle of June they hould he planted out upon one-bout ridges raifed by a double plough made for the purpule. Seven thoufand plants are fufficient for one acre; but if only fix are ufed, the roots will be the larger.

To determine how many fheep might be kept upon an acre of turnip-rooted cabbage, our author fhut up Numbepfe 200 ewes with their lambs upon a plece of poor patture- a:l acre land of no great extent ; the whule not exceeding ten acres. One ton was found fufficient for keeping them inf fufficient health for a day. Ongiving them a larger piece of ground to run over, though it had been eat all winter and late in the fpring; yet with this trifling aff tance 13 tons of turnip-cabbage were made to ferve 18 days; at the end of which the ewes and lambs were found very much improved, which could not have been expected from four acres of turnips in the month of A pril, the time that thefe were fed.

From fome trials made on the turnip rooted cabbage Experin $_{\text {ro }}$ at Cullen Houre in the north of Scotland, it appears mennsi that the plant is adapted to the climate of every part culten. of our ifland. The firit trial was made in the year houre. 1784. The feeds were fown about the middle of March in garden ground properly prepared. The cabbages were tranflianted about the middle of March that year into a dry light foil, well cleaned and dung. ed with rotten cow-dung, in rows three feet diftant from each other, and at the diftance of 20 inches in the rows. They were kept very clean, and the earth was hoed up to the roots of the plants; by which means they were probably prevented from attaining the hardnefs they would have etherwife antived at; though. after all, it was neceffary to cut the roots in two before the fheep could eat them. When thus cut, the animals eat them greedily, and even preferred then to every other food. The roots continued good for at leaft a month after the common turnips were unfit for ufe: fome of them weighed from eight to ten pounds, and a few of them more. Other trials lave fince been made; and it now appears that the plant will thrive very well with the ordinary cultare of turnips in the open fields, and in the ufual manner of fowing broad catt. Frem a comparative trial made by the tarl of Fife upon this $100 t$ with fome others, the quantities produced upon 100 fquare yards of ground were as follows:

|  |  | Sone. | ib. |
| :--- | :--- | ---: | ---: |
| Common iurnips |  | 92 | 4 |
| Cump-rooted cabbage | - | 88 | 0 |
| Carrots | - | 95 | 0 |
| Root of farcity | - | 77 | 0 |

The turnip-rooted cabbage was planted in lines 20 inches afunder; the common turnips fown broad-caft, and hand weeded, fo that they canse up very thick, being not more than three or four inches afunder when full grown. Two cows were fed for fix weeks with the turnips, two with the turnip-rooted cabbage, and two with the rout of farcity for an equal time: the two fed with turnips gave molt milk, and thofe with the root of fearcity the leal. His lordhip obServes,
swedifh ferves, however, that carrots thrive better on his farm Turnip. than any other crop: that his horfes had been fed on them at the rate of two pecks a day, with no corn, and little more than half the ufual quantity of hay. "They were kept at work every day from feven to eight hours, and were never in better order."

## Sect. IX. Swedi/b Turnip.

108

The ruta baga, or Swedifh turnip, is a plant from which great expectations have been formed. It is faid to be hardier than the common turnip, and of greater fweetnefs and folidity. It alfo preferves its frefhnefs and fucculence till a very late period of its growth, even after it has produced feed; on account of which property it has been recommended to the notice of farmers as an excellent kind of fucculent food for domeftic animals in the fpring of the year, when common turnips and moft other winter crops have failed, and before grafs got up to furnifh an abundant bite for feeding beafts. This peculiarity, fo valuable, yet fo fingular as to have led many at firft to doubt the fact, feems to be fufficiently afcertained by experiment. Dr
The Bee, Yeems to
ol. iii. p. J. Anderfon $\dagger$ in particular informs us, that it "beging or
fame time with the common turnip; but that the root in confequence of that change of flate, fuffers very little alteration. I continued to ufe thefe turnips at my table every day till towards the middle of May; and had I neser gone into the garden myfulf, I fhould not even then have fufpected, from the tafte or appearance of the bulb itfelf, that it had been thot at all. The flems, however, at the feafon I gave over ufing them, were from four to five feet high, and in full flower. I fhould have continued the experiment longer, had not the quantity I had left for that purpofe been exliautted, and a few only left for feed.
"'This experiment, however, fully proves, that this kind of turnip may be employed as a fucculent food for cattle till the middle of May at leaft, in an ordinary year; and I have not the fmallet doube but it will continue perfectly ge for that purpofe till the end of May in any feafon; at which time grafs and other fpring-crops can eafily be had for bringing beafts forward in fefl. I can therefore, without hefitation, recommend this plant to the farmer as a moft valuable Spring feeding for cattle and fheep; and for this purpofe, I think no wife farmer fhould be withour a proportion of this kind of turnip to fucceed the other forts after they fail. The profitable method of confuming it, where it is to be kept very late, is, I am convinced, to cut off the tops with a feythe or fiekle when from one foot to eighteen inches high, to induce it to fend out frefh fems, that will continue foft and fucculent to the end; whereas, withour this procefs, the flems would become tticky and ufelefs.
"I cannot, however, recommend this kind of turnip, from what I have yet feen, as a general crop; becaufe 1 think it propable, that unlefs in particular circumflances, the common tield-turnips grow to a much harger fize, and afford upon the whole a more weighty crop. Thefe, there, fhould tith continue to be cultivated for winter ufe, the other being referved only for fpring confumption.
" Experiments are fill wanting to afcertain with cerbainty the pectliar foit and culture that bett agree with V.ol. VIII. Part II.
this plant; but from the few obfervations I have hitherto had an opportunity of making upon it, it feems to me probable, that it thrives better, and grows to a larger fize on damp clayey foil, than on light fandy land. But I would not wifh to be underftood as here fpeaking pofitively; I merely throw it out as a hint for future obfervation: on fpungy foil it profpers.
"Though the ufeg of this as a garden plant are of much fmaller confequence than thofe above-fpecified, it may not be improper to remark, that its leaves form a very fweet kind of greens at any time; and merely for the fake of the experiment, 1 caufed fome of thefe to be picked off the ftems of the plants coming to feed, on the 4th of June, the king's bith day, which, on being readied, were found perfectly fweet, withour the fmallef tendency to bitternefs, which moft, if not all other kinds of greens that have been hitherto cultivated arc known to acquire after their flems are confiderably advanced; no family, therefore, can ever be at a lofs for greens when they have any of this plane in feed.
"A root of this kind of turnip was taken up this day (June 15 th) ; the feed falks were firm and woody, the pods full formed, and in fome of them the feeds were nearly ripe. The root, however, was as foft and fucculest as at any former period of its growth ; nor was the fkin, as I expected, hard or woody. It was made ready and brought to the table: fome perfons there thought the tafte as good, if rot better, than at any former period of its growth; but I myfelf, perhaps through prejudice, thought it had not quite To high a relifh as in winter: At any rate, however, there can be no doubt, that if ever it could be neceffary, it might, even now, be employed very properly as a fecding for cattle."

## Sect. X. Turnip-Cabbage.

This plant is as yet but little known. The feed is faid to have been brought from the Cape of Good Hope by Mr Haltings, where it is very common as well as in Holland. It has alfo had an exiftence in Britain for many years, though not generally known. It has a much greater affinity to the cabbage than to the turnip; and is very bardy, bearing the winter as well, if not better, than common brocoli, and may therefore be confidered as a valuable acquifition to the kitchen-grarden as well as for cattle. 'the bett time for fowing at for the garden is the end of May or beginning of June, though none of the plants have ever been obferved to run to feed though fown ever fo early. Even though fown in Auguft at the cauliflower feafon, the greater part llood throughout the following fummer, and did not fecd till the fecond fpring. The plants require nearly the fame management with brocoli as to dittance, tranfplanting, \&c. and are ufually molt efteemed when young, and about the fize of a moderate garden turnip; thofe fown in June will continue all winter. The bulb muft be ftripped clean of its thick fibrous rind ; after which it may be ufed as a common turnip. The crown or fprout is very good, but efpecially in the fpring, when they begin to run to fced. Mr Broughton, from whufe account in the Bath Papers, vol. v. this article is taken, thinks that the turnip-cabbage is more nutritious than the common turnip. The larget bulb he meafured was 23 inche
circumference; but the thicknefs of the rind is fo great, that fore farmers imagined that the bulb would be too harl! for hep. The chi Eton, however, was obviated by Mr Bioughtut, who gave Some of the overt and tong hen bibs to his here $p$, and found that they not only penetrated through the rind, but even devoured the greatest pat of it.

Sect. Xl. Cabugar.

Cabbage lase bean recommended by long expertene as an excellent food for cattle; it ufos as part of human food are alto well known. In a paper already pivoted from tho fe of the Bath Society, Scotch cabbates are compared, as to the ar unity in feeding cattle, with turnips, turnip rooted cabbage, and carrots. In this trial the cabbages land next in value to the carrots; and they are recommended as not liable to be affeted t , froth, if they be of the true flat-topped firm kind. Fifty-four tons have been railed "peon an acre of ground not worth more than 12 fillings. There is likewife an advantage attending the feeding of cattle with cabbages, viz. that their dung is more in properton than when fed with thrips or with hay; the formo r going off more by urine, and the latter having too lite? moillure. They aft impoverish the ground mid lefothan grain. Mr Billinglley accounts 46 tons fer acre a greater crop than he ever read of; but Mr $V_{\mathrm{ag}} \mathrm{g}$, in the +th volume of Bath Papers, gives an ae. count of a crop for which he received a premium from the Society, which was much fuperiur to that of Mr Bling hey. Its extent was 12 acres; the produce of the wort was $4^{2}$, and of the belt 68 tons. They were manured with a comport of line, weeds, and earth, that lay wider the hedges round the field, and a layer of dung, all nixed and turned together. About 25 cartloads of this were ferial upon an acre with the urinal ploughing given to a common fummer-fallow; but this, be fays, "adinitting fuck crop to exhaust the manure in tome degree by its groveth, an ample rectoration will be made by its refile ploughed in, and by the Airing and cleaning of the ground. The whole ex ene of an acre, exclutive of the rent, according to Mr Vars's calculation, amounts to L. 1:1+: 1, only for ones of feed being requifite for an acre. The $\$ 2$ acres, producing as above mentioned, would feed 45 oxen, and upwards of 60 Sheep, for three months; inproving than as much as the graf in the belt months of the year, May, June, and July. He recommends Sowing the feed about the middle of Augult, and transplanting the young cabbages where they may be heltered from the from; and to the neglect of this he afcribes the partial failure, or at leaf inferionty of one part of his frosind in the crop jut mentioned, the young plants nut being removed till near midfummer, and then in fo dry a time, that they were almond fcorched up.

In the Farmer's Magazine, vol. ii. p. 217. we lave Several pertinent renaiko upon the culture of this ufefut plant, particulady with regard to watering. "It is a rule (fays this correfpundint) never to water the plants, let the feafon be as dry as it may; infilling that it is entirely a' le fo. If the land is in fine alta and well dunged, this may be right, as the expence mat? be confutable; but it is probable, in very day futons, when the new in i plants have nothing but a
burning fun on them, that watering would fave vat numbers, and might very will anfwer the expence, if a pond is near, and the work done with a water -cart." He takes notice alto of another ufe of cabbages, which has not met with the attention it merits, viz. the planting of lands where turnips have failed. A late Gown crop of thefe feldom turns to any account ; but cabbages hated on the ground without any plow sling would prove wry beneficial for hep late in the faring; in all probability (unlefs on light, fandy, or limentone foils) of greater value than the turnips, had they facseeded.

Mr Marflall observes, that in the Midland difrict, a valuable fort of large green cabbage " is proparicted if not railed, by Mr Bakewell, who is not more cellbrated for his breed of rams than for his bred of cabbates. Great care is observed here in raining the feed, trice. being careful to fifer no other variety of the braffica tribe to blow near fetd-eabhages; by which means they are kept true to their kind. 'To this end, it is faid, that forme plant them in a piece of wheat; a grad method, provided the feed in that fituation can be presferved from bids."

The advantage of having large cabbages is that of being able to plant them wide enourh from each other, Dina 113 to admit of their being cleaned with the plough, and yet which the to afford a full crop. The proper diffance depends in ought io: forme meafure on the natural bize of the feces and the ftrength of the foil; the thinner they fund, the larger they will grow : but our author is of opinion, that cabbages, as well as turnips, are frequently fit out too thin. Four feet by two and an half, according to Mr Marthall, are a full dillance for lari e cabbayes on a rich foil.

## Sect. XII. Parfinips.

 entered in France and fore of our neighbouring An excels illands as food for cattle. In Brittany particularly, hone food they are thought to be little inferior in this refpect to for cattle. wheat ; and cows fed with them are laid to give as much milk, and of as good quality, as in the fumiermonths. It is alfo very much commended for fwine which rear young pigs, and for fattening the fine themfelves. The author of this paper alfo reconmends a method of determining the nutritive qualities of plants by the quantity of mucilage they contain ; which may be known by boiling them in water, and then evaporating the decoction: the parfuip, he fopposes, would yield a greater quantity of mucilage than either carrots or potatoes.
"To cultivate this root (fays Mr Hazard) fo as to Bath Pr make it advantageous to the farmer, it will be right topers, vol. foo the feed in the autumn innediat ll after it is ${ }^{2}$. 14 it ripe; by which means the plants will appear early the Mr e ${ }^{115}$ following spring, and get Prong before the weeds can ard', ne rife to injure them. Neither the feeds $n$ r $r$ young the d of plants are ever inaterially injured by fronts; on which account, as well as many others, the autumn is preferable to the faring lowing. The belt foil for them is a rich deep loan, and next to this fand. They will thrive well in a black gritty foil, but not in tonebrahe, gravel or clay; and th $y$ are always larger in the deepult earth. If the foil be proper, they do not require mach manure. Mr $\mathrm{H}_{\text {mazard }}$ obtained a very
parfips. good crop for three years upon the fame piece of ground withont ufing any; but when he laid on about 40 cart loads of fand per acre upon a lifff loam, and ploughed it in, he found it anfwer very well; whence he concludes, that a mixture of foils may be proper for this root. The feed may be fuwn in drills at about 18 inches diflance from one another, that the plants may be the more ennveniently hand or horfe hoed; and they will be more luxuriant if they undergo a fecond hoeing, and are carefully earthed, fo as not to cover the leaves. Such as lave not ground to fpare, or cannot get it in proper condition in autumn, may at that time fow a plot in their garden, and cranfplant from thence in the latter end of April, or early in the month of May following. The plants mult be carefully drawn, and the greund well pulverifed by harrowing and rolling ; after which a furrow fhould be opened with the plongh about fix or cight inches deep, in which the plants fhould be regularly laid at the diftance of about ten inches from each otber, taking care not to let the root be bent, but far the plant to tland perpendicular after the earth is clofed about it, which ought to be done immediately by means of perfons who fhould for this purpofe follow the planter with a hoe. A nother furrow mull be opened about 18 inches from the former, in the fame direction, and planied as before; and fo on in like manner until all the plants are depulited, or the field be completely cropped: and when the weeds appear, hoeing will be nect flary, and it will afterwards be proper to earth them; but if the leaves of the plants be covered with earth, the roots will be injured. Parfnips ought not to be planted by dibbling, as the ground thus becomes fo bound, as feldom to admit the fmall lateral fibres with which thefe roots abound to fix in the earth, by which they are prevented from expanding themfulves, and never attain a proper fize. When circumtlances are properlyattended to, there is little doubt that a crop of parfnips would anfwer much better than a crop of carrots.

They are equal, if not fuperior, in fattening pigs, as rarficip: they make their fleth whiter, and the animals iliemfelves are more fond of the fe routs than of carrots. Horfes eat them greedily when clean wafhed and fliced amont bran, and thrive very well upon them; and black cattle are faid likewife to approve of them.

The foregning are the principal vegetables which have as yet been recommended, or which experience has determined to be proper, to be raifed as food for men or for cattle.

One or two other plants may be juf noticed, which have lately fallen under the obfervation of thofe who apply themflves to the fudy of hubandry, aiz. the of the root of farcity, and what are called nooving cabbages. mowing Concerning the latter, no experiments have yet been mathage. made to determine futheiently their properties an salue. They are mentioned in the Bath Papers $\dagger$ by + Vo'v. Sir John Betvor, who had a finath parcel of feed fent f. 424 him; which he fowed in fpring, and feveral plants were proiuced. Some of thefe weie eut down threct times, and grew into heads again fo fpeedily, "that (fyys he) had I had leifire to have attended to them, I doubt not but that the cuttings might have been repeated; but as there is never on my furm any want of freth regetable food for catcle in the fommer, ualefs I can fund them continue to vegetate in like manner during the winter (which mine have not done) or wery early in the fpring, I think they will not prove to me, or any one under the like circumilances, an object of much value.- As to the ryot of farmity, we have no.. 11 , thing to add to what has le onfaid on it under Agri rainf culture, $n^{\circ}$ gz. Notwithllanding a great number of fesrcily, experiments, it thill appears uncertain whether it be really uffeful or not.

With regard to Grefles, the moft urf ful fpecies have 133 been deferibed under the article Grass, and the cultivation of them fo fully explained under Agricelture, as to require no furthe: enlargement here.

## Part II. Culitivation of Vegetables more properly Articies of Commerce.

THESE in general are fuch as cannot be ufed for foud; and are principally flax, hemp, tape, hops, and timber of various kinds; and of each of thefe we fhall treat paticularly in the following fections.

## Sect. I. Of Fiax and Himp.

This plant is cultivated not only with a view to the common purpofes of making !inen, but for the fake of its feed allo; and thus forms a motextenfive article of commerce, all the oil ufed by painters, at kall for common purpofes, being extraeted frum this feed. The cake which remains after the extraction of the oil is in fome places ufed as a manure, and in other: fold for fattening of cattle. In the Vale of Glouct fter, MrMarThall informs,us that it is, nest to hay, the main article of fall fatting; thougb the price is now become fo great, that it probably now leaves litete or no protit to the confumer, lasing within a fow years 1 ien from three guineas to fix and Gix and an half, and the loweft price being five guincas per ton; and even this is lower than it was lattly. Hence forne individuals have been induced to try the effect of linfeed itfolf boiled to a jelly, and mixed with Bour, bran, or
chaff, with good fuccef $f_{3}$, as Mr Marhall has been in formed; and even the oil itfelt has been tried for the fame purpofe in Hetefordhire. Though this flant is in univerfal culture over the whole kingdom, yet it eppears by the val quantity imported, that by far too mo little ground is empaloyed in that way. As Mr Mar-Culture of thall takes notice of its culture only in the county of fax in Yurk mire, it probably dues not make any great part of Yorkhist the hubbandry of the other countries of which he treats; and even in YorkBire he tells us, that its cultivation ic confued to a few diflifts. The kind culsivated there is that called "blea line," or the blue or Itad coloured flas, and this requires a rich dry foil for its cuitivation. A deep, fat, fandy loam is perhaps the only foll on which it can be cultivated wilh advan. tage. If fown upon old corn land, it ought to be well cleaned from weeds, and rendered peffenty frable by a fummer-fallow. Manure is fellom wever fet on for a line ctop; and the foil procefs confils generally of a fingle plowing. The feed time is the month of May, but much depends on the date of the foil at the time of fowing. "It Thould ncither be wet nor dis; and the furface ought to he made as fine as that of a garden bed. Not a clod of the fize of an egt frould re-

Flax and main unbroken." Two buthels of feed are ufually Hemr.

## $\rightarrow r$ rer

 fown upen an acre: the fuiface, after being harrowed, is fometimes raked with garden or hay-rakes; and the operation would be fill more complete if the clods and other ubftuctions, which cannot be eafily removed, were drawn into the interfurrows. A light handroller ufd between the final raking and harrowing would nuch affif this operation. The chief requifite during the time of vegetation is weeding, which ought to be performed with the utmolt care; and for this reafon it is particularly requilite that the ground Thould be pretiouny cleanfed as well as porfable, otherwife the expence of weeding becomes too great to be borne, or the crop mult be confiderably injured. It is an irreparable injury, if, through a dry leafon, the plants come up in two crops ; or if by accident or mifmanagament they be too thin. The goodnefs of the crop depends on ita runaing up with a fingle ftalk without branches: for wherever it ramifies, there the length of the line terminates; and this ramification is the confequence of its having ton much room at the root, or getting above the plants which furround it. The branches are never of any ufe, being unavoidably worked off in drefling; and the fem itfelf, unlefs it bear a due proportion to the length of the crop, is likewife worked off among the refufe. This ramification of the flax will readily be occafioned by clods on the ground when fown. A fecond crop is very feldom attended with any profit; for being overgrown with the fpreading plants of the firft crop, it remains weak and fhort, and at pulling time is left to rot upon the land.Flax is injured not only by drought but by froft, and is fometimes attacked, even when got five or fix inches high, by a fmall white flug, which frips off the leaves to the top, and the falks bending with their weight are thus fometimes drawn into the ground. Hence, if the crop does not promife fair at weeding time, our author advifes not to beftow further labour and expence upon it. A crop of turnips or rape will generally pay much better than fuch a crop of flax. The time of flax-harveft in Yorkfhire is generally in the latter end of July or beginning of Auguft.

On the whole, our author remarks, that "the goodnefs of the crop depends in fome meafure upon its length; and this upon its evennefs and clofenefs upon the ground. Three feet high is a good length, and the thicknefs of a crow's quill a goad thicknefs. A fine ftalk affords more line and fewer faivers than a shick one. A tall thick fet crop is therefore defirable. But unlefs the land be good, a thick crop cannot attain a fufficient length of ftem. Hence the folly of fowing flax on land which is unfit for it. Nevertluclefs, with a fuitable foil, a fufficiency of feed eveuly diftributed, and a favourable fafon, flax may turn out a very profitable crop. The flax-crop, however, has its difadvantages: it interferes with harvelt, and is generally believed to be a great exhauter of the foil, efpecially when its feed is fuffered to ripen. Its cultivatiun ought therefore to be confined to rich grafsland diftricts, where harvelt is a fecondary object, and where is exhaultion may be rather favourable than hurtful to fucceeding arable crops, by checking the too great ranknefs of rich frefh broken ground.

In the 5 th volume of Bath-Papers, Mr Bartley, near Eriftol, gives an account of the expences and produce
of live acres of flax cultivated on a rich loanyy fand. The total expence was 421.13 s .4 d. the produce was ten packs of flax at 5 l .5 s . value 52 l . 10 s .35 buthels of linfeed at 5 s . value SI. 15 s . the net profit therefore was 181 . irs. 8 d . or +1 . 3 s. +d . per acre. This gentleman is of opinion that flax growers ought to make it their llaple article, and conlider the other parts of their farm as in fubferviency to it.

In the $2 d$ volume of Bach-Papers, a Dorfethire gentleman, who writes on the culture of hemp and flax, Remarks gives an account fomewhat different from that of Mr thire genMarfhall. Infead of exbaufing crops, he maintains tleman. that they are both ameliorating crops, if cut without feeding ; and as the belt crops of both are raifed from foreign feed, he is of opinion that there is listle occafion for raifing it in this country. A crop of hemp, he informs us, prepares the land for flax, and is therefore clear gain to the farmer. "That thefe plants impoverifh the foil," he repeats, " is a mere vulgar notion, devoid of all truth. - The belt hittorical relations, and the verbal accounts of honef ingenious planters, concur in declaring it to be a vain prejudice, unfupported by any authority ; and that thefe crops really meliorate and improve the fuil." He is likewife of opinion, that the growth of hemp and fax is not neceffarily confined to rich foils, but that they may becicuat with profina bend on pround, if ted upon a little expence be laid out in manuring it. "Spal. poor as ding-moor in Lincolnfhire is a barren fand; and yet feils. with proper care and culture it produces the beft hemp in England, and in large quantities. In the ifle of Aholme, in the fame county, equal quantities are produced ; for the culture and management of it is the principal employ of the inhabitants; and, according to Leland, it was fo in the reign of Henry VIII. In Marihland the foil is a clay or ftrong warp, thrown up by the river Ouze, and of fuch a quality, that it cracks with the heat of the fun, till a hand may be put into the chinks; yet if it be once covered with the hemp or flax before the heats come on, the ground will not crack that fummer. When the land is fandy, they firf fow it with balley, and the following fping they manure the ftubble with horfe or cow dung, and plough it under. Then they fow their hemp or flax, and larrow it in with a light harrow, having fhort teeth. A good crop deftroys all the weeds, and makes it a tine fallow for flax in the fpring. As foon as the flax is pulled, they prepare the ground for wheat. Lime, marl, and the mud of ponds, is an excellent compolt for hemp-lands."

125
Our author takes notice of the valt quantity of flax Vaft qua and hemp, not lefs than 11,000 tons imported in the titics of 1 year ${ }^{1} 7^{6} 3$ into Britain ; and complains that it is not importec raifed in the iीland, which he thinks might be done, into Brim though it would require 60,000 acres for the purpofe. tain. He oblerves, that the greater part of thole rich marihy lands lying to the weft of Mendip hills are very proper for the cultivation of hemp and flax ; and if laid out in this manner could not fail of turniog out higlaly advantageous both to the landholders and the public at large. "The valt quantities of hemp and flax (fays he) which have been raifed on lands of the fame kind in Lincolnfhire marfhes, and the fens of the Ille of Ely and Hurn tingdon. fhire, are a full proof of the truth of my affertion. Many hundreds of acres in the above mentioned glaces, which, for patturage or grafing, were
e Seed. not worth more than 20 or 25 thillings per acre, lave - been readily let at 4 l. the tird year, 3 l. the fecond, and 2i. the third. The reafon of this fuppofed declining value of land, in proportion to the number of years fown with flax, is, that it is ufual with them to feed it for the purpofe of making oil, that being the principal caule of the land being thereby impoverithed.

## Sect. II. Rape or Cole Sect.

This, as well as linfeed, is cultivated for the purpofe of making oil, and will grow almoft any where. Mr Hazard informs us, that in the north of England the farmers pare and burn their panture lands, and then fow them with rape after one ploughing; the crop commonly flanding for feed, which will bring from 25 l. to 301. per laft ( 80 buthels.) Poor clay, or Itonebrath land, will frequently produce from 12 to 16 or 18 buthels per acre, and almoft any freth or virgin earth will yield one plentiful crop; fo that many in the northern counties have been raifed, by cultivating this feed, from poverty to the greateft affluence. The feed is ripe in July or the beginning of Augult; and the threfhing of it out is condueted with the greatelt mirth and jollity.

The rape being fully ripe, is firt cut with fickles, and then laid thin apon theground to dry; and when in proper condition fur threfhing, the neighbours are invited, who readily contribute their aflittance. The threfhing is performed on a large cloth in the middle of the field, and the feed put into facks and carried home. It doe's not admit of being carried from the field in the pod in order to be threfhed at home, and therefore the operation is always performed in the field; and by the number of affittants procured on this occafion, a field of 20 acres is frequently threhed out in one day. The ftraw is burnt for the fake of its alkali, the afthes being faid to equal the bett kind of tbofe imported from abroad.

The proper time for fowing rape is the month of June; and the land hould, previous to the fowing, be twice well ploughed. About two pounds of feed are fufficient for an acre; and, according to our author, it Mould be calt upon the.ground with only the thumb atd two fore fingers; for if it be calt with all the fingers, it will cume up in patches. If the plants come up too thick, a pair of light harrows mould be drawn along the field length-ways and crofs-ways; by which means the plants will be equally thinned; and when the plants which the harrows have pulled up are withered, the ground fhould be rolled. A few days after the plants may be fet out with a hoe, allowing 16 or 18 inches diftance betwixt every two plants.

Mr Hazard Atrongly recommends the iranfpianting of rape, having experienced the good effects of it himfelf. A rood of ground, fown in June, will produce as many plants as are fufficient for 10 acres; which may be planted out upon ground that has previoully borne a crop of wheat, provided the wheat be harvefted by the middle of Augult. One ploughing will be fufficient for thefe plants; the beft of which fhuuld be felected from the feed-plot, and planted in rows two feet afunder and 16 inches apart in the rows. As rape is an excellent food for theep, they may be allowed to feed upon it in the fpring; or the leaves might be gathered, and given to oxen or young cattle: freth
leaves would fprout again from the fame Italks, which in like manner might be fed off by ewes and lambs in time enough to plough the land for a crop of barley and oats. Planting rape in the beginning of July, however, would be motl advantageous for the crop itfelf, as the leaves might then be fed off in the aut 1 mn , and new ones would appear in the fpring. Our aushor difcommends the practice of fowing rape with turnips, as the erops injure one another. "Ilhofe who look for an immodiate protit (fays he), will undoubtedly cultivate rape fur feed; but perhaps it may anfuer better in the end to feed it with fheep: the fat ones might cull it over lirt, and afterwards the lean or ftore-fheep night fullow them, and be folded thereon: if this is done in autumn feafon, the land will be in good heart to carry a crop of wheat; or where the rape is fed off in the fpring, a crop of barley might follow. In either cafe rape is profi:able to the cultivator; and when it is planted, and well earthed round the ftems, it will endure the feverelt winter; but the fame cannot be advanced in favour of that which is fown broadcaft.

## Sect. III. Ceriander Seed.

Tris is ufed in large quantities by diftillers, drug. gifts, and confectioners, and might be a confiderable object to fuch farmers as live in the neighbourhoed of great towns; but the price is very variable, viz. from
 pers, Mr Barley gives an account of an experiment made on this feed, which proved very fuccefficl. Ten peaches of good fandy loan were fown with coriander on the 23 d of March 1783 . Three pounds of feed were fufficient for this fpot; and the whole expence amounted only to 5s. 10 d . The produce was 87 pounds of feed, which, valued at 3 d. yielded a profit of 15s. 11d. or 15 l . 183. 4 d . per acre. He afterwards made feveral other experiments on a larger fcale; but none of the crops turned out fo well though all of them affurded a good profit.

## Sect. IV. Canary Seed.

Thas is cultivated in large quantity in the Inte of Thanet, where it is faid they have frequently 20 buthels to an acre. Mr Bartley, in the mond of March 1783 , fowed half an acre of ground, the foil a mixture of loam and clay, but had only sight bufhels and an half, or 17 buthels per acre. With this produce, howcver, he had a protit of 41.23 .3 d . per acre.

## SECT. V. Woad.

The ufe of this in dyeing is well known, and the. conlumption is fo great, that the raifing of the plant might undoubtedly be an object to an hulbandman, provided he could get it properly manufactured for the dycrs, and could overcome their prejudices. At prefent, the growing of this plant is in a manner monopolized by forne people in particular places, particularly at Kcynham near Briftol in England. Mr Bartley informs us, that in a converlation he had with thefe growers, the latter afferted, that the growth of woad was peculiar to their foil and fituation. The foil about this place is a blackin heavy mould, with a confider able propartion of clay; Lat works fieely: that of Beiforgton, where Mr liarthy refides, an hazal, fandy lasa: neverthelefs, having fowed half an acre of this foil with woad-feed, it throve fo well, that he never faw a better crop at lioyman. Hawing no apparatus, however, or krowledge of the manufacture, he 保ired it to run to feed, learning only from the experinient, that woad is very eafily cultivated, and that the only diffactey is the preparing it for the market.
Sect. VI. Hops.

Tre ufes of thefe, as an ingredient in malt-liquors, are well koown. Formerly, however, they were fuppoled to paflefs fuch deleterious qualities, that the afe of them was forbid by act of parthament in the reign of Janles VI. Put though this act was never repeal. ed, it does not appear that inuch iegard was ever paid to it, as the ufe of hops has alll continued, and is found not to be attended witn any bad effects on the human contitution. The only yuetion, herefore, is, How far the raifing a crop of them may be prefitable to an humananan: and indeed thes leems to be very doubtful.
f Annals of Mr Arthur Young, in a fortaight's tour through Agrizultare, Kent and Eflex, mformsus $\dagger$ that at Cattle Hedingham Expeace of hop plantation, that fuar acres of hop-ground colt him them at upwards of 120 . and that the nual expences of layacre there amounted to $3 z 1$. $x$ s. Gd.; that the annual expence was 23 l. and the profit no more than 11. 8s. Id. In another place, he was infoumed by a Mr Potter, who cultivated great quantities of hops, that if it were not for fome extrandm. ry crope which occurred now and then, nubudy would plant them. In Effex, the expences of an loop plantation are fill grearer than thofe we have yet nemined; an acte undy years ago requiring 75 h. to lay it out on hope, and now not lefs than icol. the annual expence being emmated at 311. is. white the produce commonly does not exceed 32 l.

In the neighbourhood of Stow-market in this eounty, Mr Young informs us, there are about 200 acres planted with hops, but " 18 or so are grubbed up within two years, owiug to the badnets of the times." Her= they are planted on a black loofe moor, very wet and boggy ; and the mure wet the better for the crop, efpecially if the gravel, which conititutes the botiom, be aut more than three feet from the furface. In preparing the ground fur hops, it is formed intu beds it tett wide, leparated from each other by tienches. In thefe beds they make holes fix feet afunder, dud about 12 inches diameter, threc rows upon a bed. Lhto eacla hule they put about half a peck of vety rotten dung er nich compult ; fater earth upon it, and platat hwu fets in caeh; drawing eath encugh to themafterwads to torm fomething of an hillock. A hop gardon, Mr Young informs us. "will lalt whant for cres, by tonewing the hills that fail, to the amiment of abont a fore amually; but it is reckored better to grab up and new-plant it every 20 or 25 ycars"

In this volume of the Amals, Mr Xoung informs
u", tha: " one profit of top-land is that of hreaking it Cutiv. up. Mr Potter grubbed up one garden, which failinf, he ploughed and fowed barky, the erop great; then makana benas, wo acres of which prodused 16 profit quarters and five bulbels. He then fowed it with breakion wheat, which produced is quarters and four buftels ${ }^{\text {up }}$ hop and an half; but finee that ime the crops have not been greater than common. The fame gentteman has had 10 quarters of oats after wheat." Ia the ninth volume of the fame work, howevtr, we have an ac. count of an experiment hy Mr Le Bland of Sitting. bourn in kent, of grubbing up is acres of hop. ground, which was not attended with any remarkable fucetfs. Part of the hops were grubbed up in the year 1-81, and inazagan beans fown in their flead; but by reafon of the feed being bat, and the dry fummer, the crop turned out wery indiffercut. Next year the remainder of the hops were grobbed up. and the whole 12 acres fown with wheat; but Rill the crop turned out very bad, owing to the wet fumner of that year. It was nest planted with potatoes, which turned out well; and ever fince that time the crops have been grond. This gentleman informs us, that the perfon who had the hop-ground above mentioned did not lofe lefs by it than 1500 l .

The culture of hops feems to be corfined in a great Culture meafure to the fouthern counties of England; for Mr hops in Marhall mentions it as a matter of furprife, that in Nortoll Norfolk he faw a " tolerably large hop garden." The proprietor informed him, that three or four years before there had been to acres of hops in the parih (Blowlield) where he relided; which was more than could be collected in all the rett of the county ; but at toat time there were not a ove five; and the culture was daity deelining, as the crops, owing to the low price of the commotity did not defray the expence.

From anl this it appears, that hops are perhaps the moll uncertain and prearious crop on which the hut bundman can betuow his labour. Wir Young is of opinion, that fome impruvement in the culture is neceflary; bue he does not mention any, excepting that of planting them in rfalitrs. This method was recommended hoth by Mr Rogers and Mr Potter abovementioned. The former twok the hint from obferving, that a plant which had been blown down, and afterwards fhot out horizontalls, always produced a greater quantity than thole which grew upright He alio remarks, that hops which dre late picked carry more next year than fuch as are picked early; for which reafon he reeommeads the late picking. "The only reafon for picking early is, that the hops appear much more beautiful than the others.

## Sect. VII. Cultivation of Fruit.

Is Ierefordhire and Gloucelermire the cultivation of fruit for the furpofe of making a liquor from the juice, forms a principal part of heir hofbandry. In Devonthire alfo conliderable quantities of this kind of liquor are made, though much lefs than in the two counties above-mentioned.

The fruits cultivated in Herefordmire and Glousef-rywits terfire are, the apple, the pear, and the cherry. From tivaled the two firlt are made the liquors named gyler and fer. Herffo $r y$; but though it is probatle that a liquor of fome va- iblouse lae might be made from cherries alfo, it does not ap- thic.
pear to lave ever been attempted. Mr Marmall re. narks, that nature has furnifhel only one fuecics of pears and apples, wis. the cuminon crab of the woots and hedges, and the wild pear, which is likewife protey common. The varicties of thefe fruits are cutirly ar. tificial, being produced nou by toed, but by a certain mode of culture; whence it is the buinefs of thofe who wifh to improse fant the efore, to cath at liperior aceidental varictics; and having raifed then by cultivation to the highect pufecti. 1 on when they anc capable, to keep them in that thate hos areiticial popagation. Mr Marfandl, lowewr, obterves, that it is in paffile to make varictics of fruit altozether pemanent, though their daration dapends mach upon mat nagement. "A time amics (Gays he) when they can no longer he propaeated with fuceefo. All the old fruits which alfed the tane of the fiques of this country are now lolt, or to far on the ducline as to be deemed irrecoverable. 'Tlie roflecak is givea up; the celsbated fir affe is goins wits and the fandopar, which has probably furnihhed this country with more champaign than was ever imported into it, can wo longer be got tollourith: the socks eanker, and are naproductive. In Yothinire fimar corcumatices bave taken place: feveral old fruits which wote productive within my own recullectuon are bult ; the tiok can. kered, and the trecs would no longer cume to bar."

Our author controvets the common notion ano.ing orehard $m \in n$, that the decline of the old froits is waina to a want of frefh grates from abroad; particula, ly fom Nornandy, from whence it is fuppofed that af pies were ofiginally inported into this country M1 Marfhall, however, thinks, that thefe criginal kind have been long finee loft, and that the numerous varicties of which wa are now penfeflid were raife in in feed in this connery. He alfo informs us that at lecibury he was fhown a Nomandy apple tice, which, with many others of the fame kind, had besu in ponted immediately from France. He lound $1 t$, howsver, to be no other than the biser feucet, which be had feen growing as a neg!eced wilding in an Englith luedge.

The procefs of railing new yancties of apples, according 10 Mr Marthall, is fimple athu caly. ." Elect (fays he) among the native fpecies imdividuals of the higheft flavour; fow the feeos in a highly emiched
 ufe a frame or fove: Lut where the proterativa of the ordinary aratities only is wanted, an urdinary lodany foil will be fufficient. At any fate, it ought to bepre feetly clean at leail from roct weede, wind thandu be
 face being levelhed and wher thac, whe leseds wayit to be featered on about an inct: atuade r. and wisted about half an inch deep with fome of the lincle nowad previculy raked off the : ed for that intrule. swang fummer the young flatats thenid be ke pi fuitciey free from weeds, and may be takno up for tand butation the enfuing winter; or if un vers thick in thatoedbed. they may remain on it the then winter.

The nurfery ground wegl:t alio wise witice, and
 18 or 20 are prefurable. The fectugy thant ullgut to be fortec agretably to the thengith ut their rowes, that Wey may rife evenly tobthes. The top or doanwath
roots mould be taken off, and the innger fide rootlets Cutivseiten Thomenet. The young trees nimuld then be planted in of fruit, rows three feet afunder, and from 15 to 18 inches diftant in the rows; taking case not to cramp the roots, but in ledt thin ceenly and horizontally amone the mould. If they be intended merely for ftocks to be grafted. they invy remain in this fituation until they be large enough to be planted oatt thoush, in leriét management, they ought to te se tranflanted two years befure :he ir becing tranoferred into the orchard, " in frof but unn anured dowle dury ground, a quin. cunx toul teet apare cotry way." In this fecond taufplancation. as well as in the firt, the branches of the root ongthe rue to tee left two long, but to be fhercened in fach a manner as to induce them to form a glebular rous, fofficienth finall to be removed with the plant; yot fufficionty large to give it farmefs and vigour in the plantation.

Flaving proceded in this manner with the feed bed, werhon of our author gives the followinge diretrions. "Select ch ofing from anong the feedlings the plants whofe wood and the planto leaves wear the molt apple tike appearance. Tranfplane thefe intor a rich deep foil in a qenial liwation, letting them remain in this nuticry watil the begin to bear. With the feeds of the fairel, richol, and bell flavcured fruit repeat this procefs; and at the farme time, or in dak fowon, engraft the wood which produced this fruit on that of the nochel, fereted, bed Ravourend aiple: repeating this operation, and transferring the fubjuce wider improwement from one tree and fort to mother, as richmef, thour, or tirmnefs may require; continuing this double mase of inprovement until the detired fruat be ubeained. 'Ihere has, no donbe been a period when the noprovement of the apyle and pear was attended to in this country ; and fhould not the fanse faisit of improvement reviwe, it is probable that the comery will in a courle of gears, be lefe dellitute of valuatic kinls of the fe two lpecies of fruit ; whech, thoush they mas in fome degree be Acemed ubjects of Jusury, lour cutom fecas to have ratiked anong the medentives of lite."
 fuppoles th: degeneracy of apples to be rather imagi- wood' op iLary than real. He fays, that the cril complained of de geveracy $\because$ is mut a roal decline in the quality of the fruit, but in 4 aderaces the tres; wwine either to want of heallh, the feafon, ioil, monde of plating, or the Atnck they are graftel on, being two often affed from the feed of appats in the lame place or county. - l have not a doubt in my own innd, but that the trees which are grafied on the focks railed Eimm the apple pips are more :ender thar thofe gratted un the real crab-llock; and the feaform in this countey have, for many gears palk, been unfavourable for trmes, which add much to the fuppofed degeneracy ot the apple. It is my upiniun, that if planters of oretards would procure the trees grafted on real crah. Alaki frum a diflatit colontry, they wrould find their acemant in fo doing mach incibalance the ex:ra expence of charge and carriaze.

In the fame volume, Mr Edmund Gillingwater af- Mrumand figns ab a reafon for the degeneracy of apples the wasen'on maxture of varions fatiad, from the orchards beimeth.t. too near each other. In confequence of this notiun, he alto thinks that the ohd and refl kinc: of apgletrees are not lont, but oaly corrupted from being

Cu'rivation planted too near bal neighbours: "Remore them (fays

146 Mr Sanuci: "qinion of the nicthol of recusering lie beft rtit. he) to a fituation where they are not expofed to this inconvenience, and they will immediately recover their former excellency." This theory, however, is not fupported by a fingle experiment.

In this volume alfo Mr Richard Samuel expreffes his concern at the " prefent neglect of orchards, where the old trees are decaying, without proper provifion being made for the fucceeding age: for if a farmer plants frefh trees (which does not frequently happen), there is feldomany eare taken to propagate the better furts, as his grafts are ufually taken pomifcuouny from any ordinary kind molt eatily procured in the neighbourhood." His remedy is to colleet grafts from the beft trees; by which means he fuppofes that the fuperior linds of fruit would foon be recovered. To a eare of this kind he attributes the fuperiority of the fruit in the neighbourhood of great towns to that in other places.

With regard to the method of cultivating fruittrees, it is only neceffary to add, that while they remain in the nurfery, the intervals betwixt them may be oceupied by fuch kitchen -ltuff as will not crowd or overthadow the plants; keeping the rows in the mean time perfectly free from weeds. In pruning them, the leader thould be particularly attended to. If it fhoot dotble, the weaker of the contending branches fhould be taken off; but if the leader be loft, and not eafily recoverable, the plant thould be cut down to within a liand's breadth of the foil, and a frefh ftem trained. The undermoft boughs fhould be taken off by degrees, going over the plants every winter ; but taking eare to preferve heads of fufficient magnitude not to draw the flems up too tall, which would make them feeble in the lower part. The ftems in Hertfordfhire are trained to f.x feec high ; but our author prefers feven, or even half a rod in height. A tall ftemmed tree is much lefs injurions to what grows below it than a low headed one, which is itfelf in danger of being hurt, at the lame time that it hurts the crop under it. The thicknefs of the Atem ought to be in proportion to it 3 height; for which reafon a tall flock ought to remain longer in the nurfery than a low one. The ufual fize at which they are planted out in Herefordfhire is from four to fix inches girt at three feet high; which fize, with proper management, they will reach in feven or cight years. The price of thefe flocks in Herefordfhire is 18d. each. Our author met with one inflance of crablocks being gathered in the woods with a good profpect of fuccefs.

In Herefordmire it is common to have the ground of the orchards in tillage, and in Gloucetterfhire in grafs; which Mr Marfhall fuppofes to be owing to the difference betwixt the foil of the two counties; that of Herefordhire being generally arable, and Gloucefter grafs land. 'Trees, however, are very deflructive, not only to a crop of corn, but to clover and turnips; though tillage is favourable to fruit-trees in general, efpecially when young. In grafs grounds their progrefs is comparatively now, for want of the earth being ttirred about them, and by being injured by the eattle, efpecially when low-headed and drooping. After they begin to bear, eattle ought by all means to be kept away fiom them, as they not only deftroy all the fruit within their reach, but the fruit itfelf is dangerous to the cattle, being apt to ftick in their throats and choak $\mathrm{N}^{\circ}{ }_{2} 60$.
them. Thefe inconveniences may be avoided, by eat- Cultiva ing the fruit grounds bare before the gathering fea- of fru fon, and keeping the boughs out of the way of the $\quad$ r eattle : but Mr Marfhall is of opinion, that it is wrong to plant orehards in grafs land. "Let them (fays he) lay their old orchards to grafs: and if they plant, break up their young orchards to arable. This will be changing the courfe of hufbandry, and be at once beneficial to the land and the trees.

Our author complains very much of the indolent Indolen 4 and carelefs method in which the Herefordfhire and of thet Gloucefterthire farmers manage their orchards. The mers in in $p$ natural enemies of fruit-trees (he fays) are, I. A re- conpla dundaney of wood. 2. The minfetoe. 3. Mofs. of. 4. Spring frofts. 5. Blights. 6. Infects. 7. An excefs of fruit. 8. Old age.
t. A redundancy of wood is prejudicial, by reafon of Excefis the barren branches depriving thofe which bear fruit woodt of the nourifiment which ought to belong to them. ${ }^{\text {remedi }}$ A multitude of branches alfo give the winds fuch an additional power over the tree, that it is in perpetual danger of being overthrown by them: trees are likewife thus injured by the damps and want of circulation of air, fo that only the outer branches are capable of bringing fruit to maturity. "It is no uncommon fight (fays he) to fee trees in this dillrict, with two or three tires of boughs preffing down hard upon one another, with their twigs fo intimately interwoven, that even when the leaves aie off, a fmall bird can fcarcely ereep in among them.
2. The mifletoe in this country is a great enemy to Minet the apple-tree. It is cafily pulled out with hooks in how d frofty weather, when, being brittle, it readily breaks off firoyec from the branches. It likewife may be applied to a profitable purpofe, fheep being as fond of it as of ivy.
3. Mofs can only be got the better of by induftry ms is. in clearing the trees of it; and in Kent there are people who make it their profefion to do fo.
4. Spring-frots, efpecially when they fuddenly fue- Spring ceed rain, are great enemies to fruit-trees; dry frofts frofto only keep back the bloffoms for fome time. Art can give no farther affitance in this cafe than to keep the trees in a healthy and vigorous ttate, fo as to enable them to throw out a ftrength of bud and bloffom; and by keeping them thin of wood, to give them an opportunity of drying quickly before the froft fet in.
5. Blight is a term, as applied to fruit-trees, which Blight Mr Marfhall thinks is not undertood. Two bearing uncert years, be remarks, feldom come torether; and he is of opinion, that it is the mere exhaufting of the trees by the quantity of fruit which they have earricd one year, that prevents them from bearing any the nest. The only thing therefore tiat can be done in this cafe is, to keep the trees in as healthy and vigorous a ftate as poffible.
6. Infects deftroy not only the bloffoms and leaves, but fome of them alfo the fruit, efpecially pears. In the year 1783 much fruit was deffroyed by wafps. wafps Mr Marfhall advifes to fet a price upon the female wafps in the fpring; by which thefe inifchievous infects woulde erhaps be exterminated, or at leaft greatly leffened.
7. An excefs of fruit fints the growth of young of ail trees, and renders all in general barren for two or three cefs $t$ years; while in many cafes the branches are broken fruit.

## H U S B A N D R Y.

## imber-

 trees.off by the weight of the fulut ; and in one cafe Mr Marfhall mentions, that an entire tree had funk under its burthen. To prevent as much as poffihle the bad effects of an excefs of frait, Mr Mat thall recommends "to graft in the boughe," and when fully grown, to thin the bearing branches; thus cndeavouring, like the gardtner, to grow fruit every year."
8. Though it is impoflible to prevent the effeets of old age, yet by proper management the natural life of fruit.trees may be confiderab!y protracted. The mont eligible method is to graft thecks of the native crab in the boughs. The decline of the tree is preeeded by a gradual decline of fruiffulne fs, which long takes place tefore the tree manifetle any fi $n$ of decay. During this decline of fruiffuinefs, there is a certain period when the produce of a tree will no longer pay for the ground it occupies, and beyond this perinci it ought by no means to be allowed to fland. In the Vale of Gloncefter, however, our author faw an inflance of fome healely bearing apple-tiece, which then bad the fecond tops to the fame thems. The former tops hasing been worn out, were cut off, and the thamps fawgrafted. Our author obferves, that the pear-tree is much longer lived than the apple, and ought never to be planted in the fame ground. He concludes with the following general oblervation: "Thus confudering fruit-trees as a crop in huflandry, the gencral managcment appears to be this: Plant upon a recently bro-ken-up wort-out fward. Lieep the foil under a flate of arable management, until the trees be well grown : then lay it down to grafs, and let it remain in fiward until the trees be removed, and their roots be decayed; when it will agein require a counfe of arable manage.ment."

## Sect. VIII. Of Timber.Trees.

The importance and value of thefe is fo well known, that it is fuperflnons to fay any thing on that fubject at prefent : notwithlanding this ack nowled ye: value, bowever, the growth of timber is follow, and the returns for planting fo ditant, that it is generally frop. pofed for a long time to be a pulitive lofs, or at leat to be attended with no profit. This matter, however, when properly contidered, will appear in another light. There are four ditinet fpecies of woodlands; ziz. woods, timber-groves, coppices, and woody waltes. The woods are a collection of timber-trees and underwood; the timber groves contain timber-trees without any underwood: and the coppices are colleftions of underwood alone. All thefe turn out to advantage fonner or later, according to the quic $k$ or flow growth of the treec, and the fituation of the place with refpect to certain local advantages. Thus in fome places underwood is of grat confequence, as for rails, hoops, ftakes, fuel, \&c. and by reafon of the quick nefs of its growth it may be accounted the molt profitable of all plantations. An utier-bed will yidid a return of profit the fecond or third year, and a coppice in 15 or 20 years; while a plantation of oaks will not arrive at perfection in lefs than a century. This latt period is folong, that it may not unreafonably be fuppofed fikely to deter fueple from making fucls plantations of this kind, as few are willing to take any trouble for what they are never to fee in perfcêtion. It mult be
remembered, however, that though the trees themfelves do not come to perfection in a horter time, the value of the ground will always incteafe in proportion to their age. 'Thus, fays one author upoui this fubject, "we have fome knowledge of a gent!eman now living, who during his lifetime has made plantuions which in all probability will be worth to hus fon as much as his whole cftate, handfome as it is. Supporing that thefe plantations have teen made 50 or 60 yeare, and that in the coulfe of 20 or 30 more they will be wurth L. 50,000; may we not lay, that at prefent they are worth fome 20,0001 or 30,0001 ? Mr Pavier. in the $4^{\text {th }}$ volume of liath Paters, compotes the value of 50 acres of oak timber in 100 years to be L. 12,10:, whech is nearly 50 s . annualiy per acre; and if we confider that this is continually accumulating wethout any of that expence or rifk to which anumat erops are fubject, it is probable that timber plantine nuy be ac. counted one of the mole protitable aricles in burbandry. Evilyn calculates the profit of tou acres of oak-lund in 150 years, at no lefs than $1.670,000$; but this is molt probatly an exaggeration. At any rate, however, it would be improper to occupy, efpe. cially with timber of fuch now growth, the grounds which either in grafs or corn can repay the trouble of cultivation with a gord annual crop.

162
In the fourth volume of the Bath Papers, Mír Wag. Pianting Atafie rcommends planting as an auxiliary to cultiva- meicoraces tion. He brings an inflance of the fuccefs of Sir Wit. the foil. liam Jeringham, who mate trial of "the moft unpromifing ground perhaps that any rucceffol planter has hithento dttempted." Viis method was to plant becch trecs at proper diftatice: among sectel firs, upon otherwife barren heaths. "Theie trees (fays Mr WagAlaffe), in a foil per haps with out ciay or loam, with the heathy fod trenched into its broken ftrata of fand or gravel, under the protection of the firs, have laid held, thenglo flowly, of the foil; and accelerated by the fuperior growth of the firs, have proportionally rifen, until they wanted an enlargement of ipace for growith when the firs were cut down." He next proceeds to obferve, that when the firs are Eelled, their roots decay in the ground; and thus furnih by that decay a new fupport to the foil on which the beeches grow : by which means the latter receive an additional vigour, as well as an cmlargement of fpace and freer air ; the firs thenfelves, though cut down before they arrived at the ir full growth, being alio applicable to many valu able perpofes.

In the Gth volume of Annals of Agricuture, we $\mathrm{Ca}^{1{ }^{16} \text { ture or }}$ f. 1 the cu'ture of trees recommended by Mr Harries: timberand the informs us, that the larch is the quicket grow. trem re. er and the moft valuable of all the refinous timber en en by Mr trees; but unlefs there be pretty good room allowed harria. for the branches to ftretch out on the lower part of the tunk, it will not arrive at any conliderable fize; and this obfervation, he fays, holds good of all pyramidal trees. Seutch firs may be planted between them, and pulled out after they begin to obftruct the errowth of the larch. Some of thefe larches he had feen plan:ed about 30 years before, which at five feet dititance from the ground meafured from four feet :o five feet fix inches in circumference. The moll barren grensudg, he fays, would anfwer for thefe trees, but better foil

Tmber-161 Advan.
tacen or finang.
is required for the oaks. ${ }^{-1}$, D , 5 D
rice of the leares of one of his plantations of oaks hatving been almolt cutirely deftroyed by infects; in confequence of which they did not increafe in bulk as ufual : but another which had nearly efcaped thefe ravages, increafed at an average one ineh in circumference. "A tree four feet round (fays he), that has timber 20 feet in !ength, gains loy this growth a folid foot of timber annually, worth one fhilling at leatt, and pays 5 per cent. for tancing. It increafes mote as the iree gets from live to lis feet round. I have a reafonable hope to infer from my inquiry, that thave in my groves 3 coo oaks that pay me one frilling cach per annum, or L.iso a year. My poplars have gained in circumference near two inches, and a Worcefer and witch elm as much. 1 have lately been informed, that the fmooth cut of a holly-tree, that meafures 20 inches and upwards rourd, is worth to the cabinctmakers 2 s . and 6 d . per foot.
The foliowing table fhows the increafe of trees in 21 years from their firlt planting. It was taken from the marquis of Lanfdowne's plantation, begun in the year 1765, and the calculation male on the 15 th of July 1786. It is about lix acres in extent, the foil partiy a fiwampy meadow upon a gravelly bottom. The meafures were taken at five feet above the furface of the ground; the fmall firs hating been occafionally drawn for pofts and rails, as well as rafters for cottages; and when peeled of the bark, will ftand well for feven ycars.

|  | Height in Fect. | Circumferenc in Feet. Inch, |
| :---: | :---: | :---: |
| I.ombardy poplar | 60 to 80 | 8 |
| Arbcal | 50 to 70 | 46 |
| Plane | 50 to 60 | 36 |
| Acacia | 501060 | 24 |
| Elm | 40 to 60 | 36 |
| Chefnut | 30 to 50 | 29 |
| Weymouth pines | 301050 | 25 |
| Clutter ditto | 301050 | 25 |
| Scotch fir | 30 to 50 | $\bigcirc$ |
| Spruce ditto | 30 to 50 | 22 |
| Larch | 50 to 60 | 10 |

From this table it appears, that planting of timberrees, where the return can be waited for during the pace of $z 0$ years, will undoubtedly repay the original profits of planting, as well as the interef of the money laid out ; which is the better worth the attention of a proprietor of land, that the ground on which they grow may be huppofed good for very little elfe. From a comparative table of the growch of oak, anh, and clm timber, given in the rith volume of the Ampls of $A$ citicture, it appears that the oak is by much the Dowe.t grower of the thece.

With reipect to the growth of under-wood, which in fome eafes is very valuable, it is to be remarked, that in order to have an annual fall of it, the whole quantity of ground, whatever its extent may be, ought to be divided into annual fowings. The exact number of fowings mult be regulated by the ufes to which it is intended to be put. Thus if, as in Surrey, fakes, celders, and hoops are faleable, there ouglit to be eight or ten annual fowings; os if, as in $\mathrm{K}_{\mathrm{tnt}}$, hoppoles are demanded, 14 or 15 will be required; and if, as in Yorkhire, rails be wanted, or, as in Gloumefterfhire, cordwood be mof marketable, 18 or 30
fowings will be neceffary to produce a fucceffion of Timber. annual falls. Thus the bufnefs, by being divided, trect. will be rendered lefs burtbenfome: a certain proportion being every year to be done, a regular fet ot hands will, in proper feafon, be employed; and by beginning upon a imall fcale, the errors of the firt year will be corrected in the practice of the fecond, and thofe of the fecond in that of the third. The produce of the intervals will fall into regular courfe; and when the whole is completed, the falls will follow cach other in regular fucceffion. The greatell objection to this method of fowing woodlands is the extraordinary trouble in feneing: but this objection does not hold if the fowings lies at a dillance from one another; on the contrary, if they lie together, or in plots, the entire plot may be inclofed at once; and if it contain a num. ber of fowings, fome fubdivifions will be neceflary, and the annual fowings of thefe fubdivitions may be fenced off with hurdles, or fome other temporary contrivance; but if the adjoining land be kept under the plongh, little temporary fencing will be neceffary. It mull be obferved, however, that in raifing a woodland from feeds, it is not only neceflary to defend the young plants againt cattle and theep, but againht hares and rabbits alfo: fo that a clofe fence of fome kind is abfolutely neceffary. See the articles Fence and Hedge.

With regard to the preparation of the ground for raifing timber, it may be obferved, that if the foil be of a ftiff clayey nature, it hould receive a whole year's fallow as for wheat ; if light, a crop of turnips may be taken; but at all events it mull be made perfectly clean before the tree feeds be foon, particularly from perennial root weeds; as, after the feeds are fown, the opportunity of performing this neceflary bufinefs is in a great meafure loit. If the fituation be moift, the foil fhould be gathered into wide lands, fufficiently round to let the wates run off from the furface, but not high. The time of fowing is either the month of October or March; and the method as follows: "The land being in fine order, and the feafon favourable, the fowing whole flould be fown with corn or pulfe adapted to the feafon of fowing : if in autumn, wheat or rye may be the crop; but if in fpring, beans or oats. Whichever of thefe three fpecies be adopted, the quantity of feed ought to be lefs than ufual, in order to give a free admiffion of air, and prevent the crop from lodging. The fowing of the grain being completed, that of the tree-feeds mutt be immediately fet about. Thefe ase to be put in drills acrofs the land: acorns and nuts fhould be dibbled in, but keys and berries feattered in trenches or drills drawn with the corner of a hoe, in the manner that gardeners fow their peafe. The diftance might be a quarter of a tlatute rod, or four feet and one inch and an half. A land chain thould be ufed in fetting out the drills, as not being liable to be lengthened or fhortened by the. weather. It is readily divided iato rods; and the. quarters may be eafily marked.

The fpecies of under-wood to be fown mult be determined by the confumpt of it in the neighbourhood of the plantation. Thus, if ftakes, hoops, \&c. be in requelt, the oak, hazel, and afh, are efteemed as under-wood. Where charcoal is wanted for iron forges, beech is the prevailing underwood. The oak,
rimber- box, birch, \&cc. are all in requeft in different courtrics, trees. and the choice mult be determined by the prevailing demand. As the keys of the ah fometimes lic ewo or even three years in the ground, ir will be proper to have the places where they are fown diflinguithed by fome particular marks, to prevent them from being difturbed by the plongh after havell ; as a tew beans feattered along with them, if the crop be wats; or oats, if the crop be beans. The crop fhould be reaped not mozun, at larvett time, and be carried off as fatt as porfible. Between harvelt and winter, a pair of furrowes mond be laid tack to back in the middle of each illterval, for meliorating the next yoar's crop, and laying the feedling plants dry : whle the nubble of the unploughed ground on each fide of the drills will keep them warm during the winter. 'lhe next year's crop may be potatoes, cabbages, turnips, or if the firft was corn, this may be beans; if the firlt was beans, this may be wheat drilled. In the fpring of the third year the drills which role the firltyear mult be looked over, and the vacancies hilled up from thone parts which are thickele; but the drills of the ath mould be let alune till the fourth year. The whole thould afeerwards be looked over from time to time; and this, with cultivating the intervals, and keeping the drills free from weeds, will be all that is necellary until the tops of the plants begin to interfere.

The crops may be continued for feveral years; and if they only pay for the expences, they will thill be of confiderable advantage by kseping the ground ftirred, and preferving the plants from hares and rabbits. Even after the crops are difcontinued, the ground ought ltill to be firred, alternately throwing the
tnould to the roots of the plants, and gathering it into Tumbera ridge in the widdle of the interval. The bett method of doing this is to folit the ground at the ap.

## ercer.

 $\underbrace{\text { crer. }}$ pruach of winter in order to throw it up to the trees on both fidss; this will preforve the root, from frod: sather it again in the fpring, which will check the weeds, and give a frefl fupply of air: fplic again at mid-Iamenet, to preferve the planes from drought: gather, if necelfary, in autumn, and fplit ay befuee at the approach of winter. The fpring and mid.fummer ploughings fhuuld be continued as long as a plough can pals between the plante.Whencser the saks intencied for timber are in dan. ger of bing drawn up too flender for their beighe, it will be neceltary to cut off all the rell at the heiplit of about an handbreadth above the ground: and thufe deligned to flad mult now be planted at about two ruds dillant from each other, and as nearly a yuincunx ss poffible. 'The lecond cutting mutt be determined by the demand there is for the under. wool; with only this provifu, that the timber flands be not too much crowded by it; for rather than this thould be the cafe, the coppice hould be cut, though the wood may not have reached its molt protitable thate. What is here faid of the method of rearing oak-trees in wouds, is iti a great neafure applicable to that of railing uther trees in timbergioves. The fpecies moft ufually raifed in thele are the dfle, elie, beech, larch, fprace fir, Weymonth pine, poplar, willuw, alder, chefnut, walnut, and cherry. 'The three latl are ufed as fubltitutes for the oak aad beech, aad thefe two for the mahogany.

## Partill. Of the Cattle proper to be employed in Farm-Wore; Rearing and Management of them. Of Hogs, Poultry, \&ec. Management of bees. Of the Darry. Of Manures.

## Sect. I. Of the Cattlo proper to be employed.

As great part of the flock of an hurbandman mull always conlift of cattle, and one of his principal ex. pences in the maintenance of them, this part of his buli. neff is certainly to be looked upon as one of the mot important of the whole. The cattle belonging to a farm may he divided into two clafles, viz. luch as are intended for work, and fuch as are detigned for falc. The former are now principally horfes, the oxen formerly employed being fallen into difufe. though it does not yet certainly appear that the reafons for the ex. clange are fatisfazory. In the fecond volume of Bath Papers, we have account of a comparative experiment of the utility of borfes and oxen in hufbandry by Mr Kedington near Bury in Suffulk, in which the preference is decifively given to oxen. He infurms us, that at the time he began the experiment (in 1779), he was almolt certain that there was not an ox worked in the whole county; finding, however, the expence of horfes very great. he purchafed a fingle pair of oxen, but found much difficulty in breaking them, as the workmen were fo much prejudiced againft them, that they would not take the priper ptins. At lafl he met with a labourer who undertook the talk; and the
oxen " foon became as tractable and $2 s$ handy, both at ploughing and carting, as any horfes." On this he determined to part with all his cart-horfes; and by the time he wrote his letter, which was in 1781 , he had not a lingle horfe, nor any mure than fix oxen; which ineonfiderable number perfurmed with eafe all the work of his farm (confilling of upwards of 100 acres of arable land and 60 of pallure and wood), brlides the thatute duty on the highways, timber and corn, carting, harrowing, rolling, and every part of rural bufinefs. They are condantly fhoed; their harnefs is the fane as that of hurfes (excepting the neceflary al. terations for difference of lize and thape); they are driven with bridles and bits in their mouths, anfwer. ing to the fame words of the ploughman and carter as horfes will do. A fingle man bolds the plough, and drives a pair of oxen with reins: and our author in. forms us, that they will plough an acte of ground in lefs than eight hours cime; he is of opinion that they would do it in feven. The intervals of a finall plan. tation, in which the erees are fet in rows ten feet afun. der, are ploughed by a fingle ux with a light plough, and he is driven by the man who holds it. The oxen go in a cart either fingle, or one, two, or three, according to the load. Four oxen will draw \&o buthels of barley or oats in a waggon with eafe; and if good

Carte to be of their kind, will travel as fall as horfes with the fame emplosed load. One ox will draw 40 bufthels in a light cart,
16 Reilion fi, On the whale, he prefers oxen to horfes for the followysetertins ing reafons.
orea to $\quad$. They are kept at much lefs expence, never eating 1.cetio. meal or corn of any kind. In winter they are fed
with Araw, turnips, carrots, or cabbages; or inltead of the three lalt, they have each a peck of bran per day while kept conftansly at work. In the fpring they eat hay; and if working harder than ufual in feed time, they have bran belides. When the vetches are fit for mowing, they get them only is the ftable. After the day's work in lummer they have a fmad bunde of hay, and tand in the Mable till they evol; ateer which they are turned into the patture. Our author is of opinion, that an ox may be maintained in condition, for the fame courant work as an horfe, for at leatt fi. lefs annually.
2. After a horfe is feven years old, his value de. :lines every year; and when lame, blind, or very old, he is fearce worth any thing; but an ox, in any of thefe fituations, may be fatted, and fuld for even more than the firlt purchafe; and will always be fat foomer after work than before.
3. Oxen are lefs liable to difeafes than horfes.
4. Hurfes are frequently liable to be fpuiled by fervants riding them without their matter's knowledge, which is not the cafe with oxen.
5. A general ufe of oxen would make beff plentifill, and confequently all other meat ; which would be a national benefit.
Mr Kedington concludes his paper with acknowledging, that there is one inconvenience attending the ufe of oxen, viz. that it is difficult to thoe them ; tho' Even this, he thinks, is owing rather to the unkilfulnefs of the fimiths who have not been aecultomed to thoe thefe animals, than to any real difficulty. He confines them in a pound whi'e the operation is performing.

Mr Marlhall, in his Rural Economy of the Midand counties, hows the advantage of employing oxen in preference to horfes from the mere article of expence, whieh, according to his calculation, is enormous on the part of the horfes. He begins with effimating the number of !quare miles contained in the kingdom of England; and this he fuppoles to be 30.000 of cultivated ground. Suppoling the work of hubandry to be done by horfes only, and each fquare mile to employ 20 horfes, which is about 3 to 100 acres, the whole number ufed throughout Briain would be 600,000 ; from which deducting one fixth for the number of oxen employed at prefent, the number of horfts jult nuw employed will be 500,000. Admitting that each horfe works ten years, the number of farm-horfes which die annually are no fewer than 50,000 ; each of which requires full four years keep before he is fit for work. Horfes indeed are broke in at three, fome at two, years old, but they are, or ought to be, iadnged in keep and work till they are fix; fo that the colt of rearing and keeping may be laid at full four ordinary years. For ali this confumption of vegetable produce he returns not the community a fingle article of food, ctuthing, or commeree; even his fikin for econonsical purpufes being barely worth the taking off. By working horfes iv the affairs of hufoandry, there. Fore, "the community is loling annually the amount
of 200,000 years kcep of a growing horfe;" which at Catte ro b the low ellimate of five pounds a-year, amoments to a million ammally. On the contrary, fuppufing the bufincis of huibsudry to be done foldy by catte, and admitting that oxen may be fatted with the fame ex. aun br penditure of vegetable produce as that which old horfes tor by require to tht them for full work, and that inflead of kecping 50,000 horfes dying, 50,000 uxen, of no more than 52 thone each, are anmaty flanghtered; it is evident, that a quantity of beef nearly cyual to what the city. of London confumes would be annally brought into the market; or, in other words, 150,000 additional inhabitants might be fupplied with one pround of animal food a-day each; and this without confuming one. additional blade of grafs. "I anı far from expecting (fays Mr Marhall), that cattle will, in a thors face of time, become the univerlal beals of draft in huf. bandry; nor will I contend, that under the prefentcircumftances of the inland they ought in thrit propriety to be ufed. But 1 know that catte, undes proper management, and kept to a proper age, are, equal to every work of huflandry, in molt if not allfituations: And I am certain, that a much greater. proportion than there is at prefent might be worked with confiderable advantage, not to the community only, but to the owners and occupiers of lands. If only une of the 50,000 carcafes now loit annually $t$. the community could be reclaimed, the faving would be an object."
$173^{\circ}$
In Norfolk, our author informs us that horfes are.No nsen. the only beafts of labour ; and that there is not per- wred in haps one ox worked throughout the whole county. Notfolk It is the fame in the Vale of Glouce?er, though oxer are ufed in the adjoining counties. Formerly fome objection oxen were worked in it double; but they were found to them in to poach the land too much, and were therefore given the Vale e up. Even when worked fingle, the fame objection is Gloucent made : but, fays Mr Marfhall, "in this I fufpect there is a fpice of obltinacy in the uld way; a want of a due portion of the firit of improvement; a kind of indolence. It might not perhaps be too fevere to fay of the Vale farmers, that they would rather be eaten up by their horfes than Alop out of the beaten tract to avoid them." Shoeing osen with whole hoes, in our author's opinion, might rensedy the evil complained of; but " if not, let thofe (lays he) who are advocates for oxen calculate the comparative difference in wear and keep, and thofe who are their enemies ellimate the comparative mifchiefs of trading; and thas deeide upon their value as beatts of labour in the Vale.". In the Cotfwold oxen are worked as well as horles; Ufelin but the latter, our author fears, are fill in the pro. Coffivold portion of two to one: he has the fatisfaction to find, however, that the former are coming into more gene: ral ufe. They are worked in harnefs; the collar and harnets being ufed as for horfes, not reverfed, as in moll cales they are for oxen. "They appear (fays our suthor) to be perfectly handy, and work, either at plough or cart, in a manner which fhows, that although horfes may be in fome eafes convenient, and in moft cafes pleafuralle to the driver, they are by no means necif. fary to hufbandry. A convenience ufed in this courn $\mathbf{N D}^{176}$ try is a noveable hurn:/s-houfe, with a fledge bottom, harnefrwhiel is drawn from place to place as oceafion may re- houfe. quire. Thus no labour is lolt either by the oxca.os their divers.

In Yorkmire oxen are fill uled, though in much fewer numbers than formerly ; but our author does not imagine this to be any decinve as sumem againat their utility. The Yorkthire plough was formerly of fuch an unwieldy contruction, that four ur lix oxen, in yokes, led by two horfes, were abfohately requifite to draw it; but the improvements in the combluction of the plough have of late been fogreat, that two horfes are found to be fufficient for the purpofe; fo that as Yorkmire has all along been famous for its bree 1 of borfes, we are not to wonder at the prefent difule of oxen. Even in carsiages they are now much difufed; but Wh Martrall alligiss as a reaton for this, that the roads were formerly deep in winier, and fof to the hoof in lummor ; but now they are univerfally a cau!eway of hard limeltones, which hurt the feet of oxen even when flod. "fhus it even appears matier of furprife to our author that fo many osen are employed in this county; and the employment of them at all is to him a convincing argument of their utility as bealls of dranght. The timber caniers fill continue to ufe them, even though their employment be folely upon the road. They find them not only able to fland working every day provided their feet do not fail them, but to bear loug hours becter than horfes going in the fame palture. An ox in a good patture foon fils his belly, and lies down to refl ; bus an horle can fearce alfo conlidered as much fuperice at a difficult pull horfes; but this he is willing to tuppofe arifes from their ufing half-bred hunters in Yorkitire, and not the true breed of cart hotfes. "But what (fays he) are thorough-bred cart-holfes? Why, a tpecies of trong, heavy;, fluggifh animals, adapted fokly to the purpole of draught; and according to the prefent law of the country, cannot, without an annual expence, which nobody bellows upon them, be ufed for any other purpofe. This ipecics of bealls of drauglat coll at four years old from 2 cl . to 30 l .; they will, with extravagant keep, extraordinary care and attendance, and much good luck, continue to labour eight or ton years; and may then generaily be fold for live flit. lings a.head. If we had no other feccies of animals adapted to the purpofes of draught in the illand, cart horfes would be very valuable, they being much fuperior to the breed of faddle horfes for the purpofe of dranght. But it appears evident, that were only a fmall thare of the attention paid to the beeeding of draught oxen which is now betowed on the breeding of cart-horfes, animals equal!y powerfal, more active, lefs coftly, equally adapted to the purpoles of hufandry if harneffed with equal judgment, lefs expentive in keep and attendance, much more durable, and irifnitely more valuable after they have tinifhed their labours, might be produced. A Ateer, like a cole, oughe to. be familiarized to harnefs at two or three years old, but thould never be fubjected to hard labour until he be five years old; from which age, uotil he be 55 or perhaps 20 , he may be contidered as in his prime as a bealt of draught. An ox which I worked feveral years in Surrey, might at 17 or 18 years of age have challenged for Arength, agility, and fagacity, the bell bred cart-horfe in the kingdom."

I'He midland counties of England have for fome $\underbrace{}_{1 \rightarrow 0}$ time been celcbrated on account of their beced of the Accoune of Whick cars--/verje; though Mr Marfhall is of opinion that the black this kind are ueprofitable as beats of draugit in huf. cast horls. bandry. The prefent improvement in the breed took its sife from fix Zealand mares fent over by the late Lord Cheftertield during lis embuffy at the Hague. 'There marts being lodged at his lordihip's lieat at Bretby in Derbythire, the breed of hurfes thus became improved in that comsty, and for fome time it took the lead for the fpecies of thele animals. As the imprused beerd paflid into Leicellerlhire, however, througla fome unknown circumatanes, it became flill more umproved, and Leicelter has for fome time taken the lead. It is now found, however. that the very farge horfes formerly bied in this dilirict are much lef's 189 weful than fuch as are of a fmatler lize. Mr Marihali Horfes be-s deferibes in magnificent terms one of there darge horfes, Mr Bak. to a llallion belonging to Mr Bakewell named $\mathrm{K}(\mathrm{A})$, well detcris. which, lue fays, was the handfomell horfe he ever faw.bed.
"He was (fays he) the fancied war-harfe of the German parnters; who, in the luxuriance of imagination, never perhaps excelled the nateral grandeur of this horfe. A man of moderate fize feemed to thrink behind his fore end, which rofe fo perfectly upright, his ears Mood (as Mr Bakewell fays tvery horfe's eard ought to lland) perpendicularly ouer his fore fect. It may be faid, with little latitudc, that in grandeur and fymmetry of form, wiewed as a picturahic object, he excetded as far the horfe which this fuperior breeder had the honour of thowing to his Majelty, and which was afterwards hown publicly at London, as that horfe does the meanelt of the breed." A more ufefulhorfe, bred alfo by Mir Bakeweil, however, is defribed as having " a thick carcale, his back thort and draight, and his legs thurt and clean : as throng as an ox, yot active as a poney ; equally fuitable for a cart or a lighter carriage."

The dhallions in this connty are hred eithar by farmers or by perfons whofe butheds it is tu brad them, and who therefore have the name of bechers. Thefe lat either cover with them themielves, or tet them ont to others for the feafon, or fell them altogether to llal-lion-men who travel about with them to different places. - The prices given for them are from 50:0 ${ }^{\text {as }}$ : 200 guines by purchafe; from 40 to 80 or a hun- Aathors. dred by the fealou; or from hald a guinea to two gui. neas by the mare. 'Ihe mares are mutlly kept by the farmers, and are worked until near the times of foaling, and moderately afterwards white they fuckle: the belt time for foaling is fuppofed to be the month of March or April; and the time of weaning that of November. - "The price of foals (fays Mr Marhall), for the lalt ten years, has been from live to ten pounds or guncas; for yearlings, 10 to 15 or 20 ; for two-year-olds, is to 25 or 30 ; for lix-ycar-olds, from 25 r83 to 40 guineas." - Our anthor acknowledges that this Mr \$arbretd of hories, contidered abilractedly in the light in Mas! 1 , 5000 which they appear here, are evidently a pront ifle fpes. iervations cies of live llock, and as far as there is a market foping hurice fix-years-old horfes of this breed, it is profitable to a-
griculture.
(A) Mr Bakewell dilitiguifies all his horfes, bulls, and rams, ing the liters of the niphabes.

1) if Tent limd of hionfes.
gricularc. "But (fays he) viewing the bufinefs of agriculure in general, not one occupier in ten can partake of the profit; and being keot in agriculture after they have reached that proftable age, they become iadifputably one of its heaviet burdens. For befides a ceffation of improvement of four or five guineas a year, a decine in value of as much yearly takes place. Even the brood-mares, after they have palfed that age, may, unlefs they be of a very fuperior qua-

18:
Notflk
irce!deiur:bte.

Our author complains that the ancient breed of Norfoik hories is almolt entirely worn out. They were fmall, brown-muzited, and light boned; but they coult endure very heary worl: with little food : two of them were found quite equal to the plough in the foil of that county, which is not deep. The prefent Fiuf olk and cointhire and Leicellerfhire already mentioned. He Gioucefter approves of the Suffolk breed, which (he fays) are a breeds. dapted to the Norfolk hufbandry than the L icefterthire breed; their principal faulr, in his opinion, is a flatnefs of the rib. - In the Vale of Glonceller mot firmers rear their own plough-horfes, breeding of horfes not being practifed. They are of a very ufful kind, the colour moitly black, inclinable to tan colour, fhort and thick in the barrel, and low on their legs. The price of a fix-year-old horfe from 251. to 351. Some cart horfes are bred is Cotlivold hills; the mares are worked till the time of foaling, hut not white they fuckle; and the foals are weaned early,
while there is plenty of grain upon the gronad.
Yorkthire, which has been long celebrated for its breed of horfes, ftill itands foremoft in that refpect among the Englih counties. It is principally remarkable for the breed of faddle-horfes, which cannot be reared in Norfolk, though many attempts have been made for that purpofe. Yorkfhire ftallions are frequently fent into Norfolk; but though the foals may be handfome when young, they lofe their beauty when old. In Yorkthire, on the other hand, though the foal be ever fo unpromifing, it acquires beauty, Hrength, and activity as it grows up. Mr Marflall fuppofes that from five to ten thoufand horfes are annually bred up between the eallern Morelands and the Humber.
"Thirty years ago (fays Mr Marfhall), ftrong fadde-holfes, fit for the road only, were bred in the Vale; but now the prevailing breed is the fafhionable coach-horfe, or a tall, Ifrong, and over-fized hunter; and the fhows of ftallions in 1787 were flat and fpiritlefs in compaifon with thofe of 1783. ." The black cart-horfe, an object of Mr Marfhall's peculiar averfion, is affo coming into the Vale.

In the breeding of horfes he complains greatly of the negligence of the Yorkhire people, the mares being almoft totally neglected; though in the brute creation almoft every thing depends upon the female.

With regard to the general maintenance of horfes, we have already mentioned in this article, and that of Agriculture, feveral kinds of food upon which experiments have been made with a view to determine the molt profitable mode of keeping them. Perhaps, however, the moft certain method of afcertaioing this matter is by obferving the practice of thofe counties where horfes are moft in ufe. Mr Maxfhat recoromends
the Norfolk management of horfes as the cheapet method of feeding them pratifed any where; which, however, he feems willing to afcribe in a great mea- horf kinds fure to the excellency of their breed. In the winter 186 months, when littlc work is to be done, their only Norfoll rack-meat is batley.fraw ; a referve of clover-hay be-manag ing uftrally made againtt the hurry of feed time. $A_{\text {horfes }}^{\text {ment }}$ buthel of corn in the molt bufy feafon is comouted to corame be an ample allowance for each horle, and in more ed. kifure times a much lefs quantity fuffices. Oats and fometimes barley, when the latter is cheap and unfaleable, are given; but in this cafe the barley is generally malted, i. e. Ateeped and afterwards fpread abroad for a few days, until it begin to vegetate, at which time it is given to the horfes, when it is fuppofed to be lefs heating than in its natural Itate. Chaff is univerfally mixed with horfecorn : the great quantities of corn grown in this country afford in general a fufficiency of natural chaff; fo that cut chaff is not much in ufe: the chaff, or rather the awns of barley, which in fome places are thrown as ufelefs to the dunghil, are here in good cfteem as provender. Oat-chaff is defervedly confidered as being of much inferior quality. - It may here be remarked, that this method of keeping horfes Hots which My Marfhall approves of in the Norfolk far-lowed mers, is practifed, and probably has been fo from time many immenorial, in many places of the north of Scotland; land. and is found abundantly fufficient to enable them to go through the labour required. In funmer they are in Norfolk kept out all night, generally in clover leys, and in fummer their keep is generally clover only, a few tares excepted.

In the fourth volume of the Annals of Agriculture, Calcu Mr Young gives an account of the expence of keep. tivns ing horles; which, notwithltanding the valt numbers exper kept in the ifland, leems itill to be very indeterminate, fes. as the informations he reccived varied no lefs than from L. 8 to L. 25 a-year. From accounts kept on his own farm of the expence of horfes kept for no other purpofe than that of agriculture, he flated them as follows:

Average on the whole L. 11: $12: 3$.
By accounts received from Nortbmims in Hereford. hire, the expences flood as follows:

| 1768 | Expence per horfe |  |  | L. | s. | $d$. |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| 1769 | - | - | - | 20 | 7 | 0 |
| 1770 | - | - | - | 15 | 8 | 5 |
| 1771 | - | - | - | 14 | 14 | 2 |
| 1772 | - | - | - | 15 | 13 | 3 |
| 1773 | - | - | - | 18 | 4 | 0 |
| 1774 | - | - | - | 15 | 11 | 8 |
| 1775 | - | - | - | 14 | 4 | 5 |
| 1776 | - | - | - | 19 | 0 | 5 |
| 176 |  | - | 14 | 5 |  |  |

Average L. 16: 13: 1.
On thefe difcordant accounts Mr Young obferves, undoubtedly with juftice, that many of the extra expences depend on the extravagance of the fervants; while fome of the apparent favings depend either on their careleffnefs, or fealing provender to their beafts privately,
kearing privately, which will frequently be done. He con-
cludes, however, as follows: "The more exactly the expence of horfes is examined into, the more advan. tageuns will the ufe of oxen be found. Every day's experience convinces me more and more of this. If horfes kept for ule alone, and nut for how, have pro. ved thus expenfive to me, what mun be the expence to thofe farmers who make their fot ficek teams an object of vanity? It is ealier conceived than calculated.

## Sect. HI. Of the Breeding and Rearing of Black Catili.

Thestare reared for the two different purpofes, viz. work, and fattening for flaughter. For the former purpofe, Mr Marfhall remarks, that it is obvioully neceffary to procure a breed without homs. This the thinks would be no difadvantage, as lom, though formerly an artiche of fome requeft, is now of very lithe value. The horns are quite ufelefs to cattle in the ir domeftic fate, though nature has befowed them upon them as weapons of defence in their wild thate; and our author is of opinion that it would be quite practicable to produce a hornkfefs breed of black-cattle as well as of fheep, which laft has been done by atteation and perfeverance; and there are now many hornlefs breeds of thefe creatures in Britain. Nay, he in fills, that there are aheady three or four breeds of hornlefs catte in the inand; or that there ate many kinds of which numbers of individuals ase hornlefs, and from thefe oy proper carc and attention a breed might be formed. The firl itep is to felect females; and having obferved their impeffections, to endeavour to correct them by a well chofen male.

Tlie other properties of a perfect breed of black cattle for the purpoles of the dairy as well as others, ought, according to Mr Markall, to be as follows. 1. The head fmalland clean, to leffen the quantity of offal. 2. The neck thin and clean, tolighten the foreend, as well as to leffen the collar, and make it fis clofe and eafy to the animal in wo:k. 3. The carcafelarge, the chelt deep, and the bofom broad, with the ribs flanding out full from the fpine; to give frength of frame and conftitution, and to admit of the intellines being lodged within the ribs. 4. The Thoulders fhould be light of bone, and rounded ofi at the lower point, that the collar may be eafy, but broad to give ferength; and well covered with 品俭 for the greater cafe of draught, as well as to furninh a defired point in fasting caatle. 5. The back ought to be wide and level throughout; the quarters lorg; the thighs thin, and flanding narrow at the round bone; the udder large when full, but thin and loofe when empty, to hold the greater quantity of milk; with large dug.veins to fill it, and long elaric trats for drawing it off with greater eafe. 6. The legs (below the knee and hock) Atraight, and of a middle length; their bone, in general, light and clean from fethinefs, but with the jointe and finews of a moderate fize, for the purpofes of Arength and activity. 7. The flefh ought to be mellow in the fiate of ferhinefs, and firm in the flate of fatnefs. 8. The hide mellow, and of a middle thicknefs, though in our author's opinion this is a point not yet well determised.

As the milk of cowg is always an article of feat Rearng importanec, it becomes an objece to the huftandonan, if poflible, to prepent the wafte of that ufful fluid, which in the common way of rearing calpes is unavoidable. 192 A method of bringing up thefe yount antrala at lefs of rearing expence is propofed by the Duike of Northamberland. eates His plan is to make Rimmed milk anfwer the purpofe mithout of that which is newiy drawn from the teat ; and which, he fuppofes, inight aniwer the purpot: at one inn ites third of the expence of new milk. The articles to be wo maze added to the tkimmed milk are treacle and the cura. $\Gamma .2 g 6$. mon linferd oil cake ground very fine, and alnooft to an impalpable powder, the quantitics of each being fo fmall, that to make $3^{2}$ gallone would coll only 6 d . befides the fammed milk. It mixes very readly and almol intimately with the mik, making it more rich and mucilazinone, without giving it any difagree:ble talie. The rectipt for making it is as folluws. 'lake une gallon of frimmed milk, and to about a pint of it add half an ounce of treacle, thirring it until it is well mixed; then take one ounce of linfeed oil-cake furely pulverifed, and with the hand ler it fall gradually in very fmall quantities into the milk, flir. rillg it in the mean time with a fpoon or ladle until it be throughly incorporated; then let the mixture be put into the other part of the milk, and the wholc be made neariy as warm as new milk when it is fark taken from the cow, and in that ftate it is fit for ufe. The quantity of the oil cake powder may be increafed from time to time as occalion requircs, and as the calf becomes inured to its flavour. On this fubjeat Mr rg: Young remarks, that in rearing calves, there are two Mryoune objects of great imporiance. 1. To bring them upexperiwithout any milk at atl ; and, z. To make kimmed ment. milk anlwer the purpofe of fuch as is newly milked or fucked from the cow. In conferquence of premiums offeced by the London Socitty, many attempts have been made to accomplifh thefe delirable purpofes; and Mr Budel of Wanborough in Surrey was rewarded for an account of his method. This was no other than to give the creatures a gruel made of ground barkey and oass. Mr Young, however, who thied this nucthod with two calves, affures us that both of them died, though he afterwards pot them upon milk when they were found not to thrive. When in Ircland be had an opportunity of purchating calves at thrce days old from 20d. to 3s. each; by which he was induced to repeat the experiment many times over. This he did in differcnt ways, having collected various receipts. In confequence of thefe the tried hay-tea, bean-meal mixed with wheat-lour, barley and oats ground neasly, but not exactly, in Mr Budd's method; but the principal one was flax-feed builed into a jelly, and mixisd with warm water; this being recommended more than all the refl. The refult of all thefe triala was, that out of 30 calves only three or four were rearcd ; thefe few were brouglit up with barley and oatmeal, and a very fmall quantity of flax-feed jelly ; one only excepted, which at the defire of his coachman was brought up on a mixture of two-thirds of skimmed milk and one third of water, with a frall addition of flax jelly well diffolved.

The fecond object, viz. that of improving Rimmed milk, according to the plan of the Duke of Northum. berland, feems to be the more praticable of the two.

tomed to a fevere climate will fland the winter in the Rearin field much better than thole which have been brought and fath up under fhetter．It is lilewife afferted by fome，with a great deal of probability，that the flefh of cattle fat－ ted under cover is lefs agreeable than that of fuch as are allowed to remain in the open air．

## Sect．IV．Of the Rearing and Fattering of Hogs．

The practice of keeping thefe animals is fo general， efpecially in England，that one frould think the profit attendiug it would be abfolutely indifputable；and this the more tfpecially when it is confidered how little nicety they have in their choice of food．From fuch experiments，however，as have been made，the matter appears to be at leaft very donbtful，unlefs in particu－ lar circumftances．In the firft volume of Annals of Agriculture，we have an experiment by Mr Murc of feeding hogs with the cluter－potato and carrots；by which it appeared，that the profit on large hogs was much greater than on frall ones；the latter eating al－ moft as much as the former，without yielding a pro－ portionable increafe of fich．The gain was counted by weighing the large and finall ones alive；and it was found，that from November 10 th to January 5 th，they had gained in the fotlowing proportion：

On being finifhed with peafe，however，it appeared， that there was not any real profit at laft；for the ac－ counts flood ultimately as follow： gentleman，in 1787 ，weaned if calves；in 1788， 23 ； and in $1789,15 . \ln 1787$ ，he bunght three facks of linfeed，value L． 2,5 s．which latted the whole three years．One quart of it was put to fix quarts of water； which，by boiling 10 minntes，was reduced to a jelly： the calves were fed with this mixed with a fmall quan－ tity of tea，made by fteeping the beft hay in boiling water．Dy the ufe of this food three times a day，he fays that his calves throve beter than thofe of his neighbours which were reared with milk．－Thefe un－ natural kinds of food，lowever，are in many cafes apt to produce a loofenefs，which in the end proves fatal to the calves．In Cornwall they remedy this fonetimes by giving acorns as an altringent；fumetimes by a cor－ dial ufed for the human fpecies，of which opium is the

In Norfolk，the calves are reared with milk and tir－ nips ；fometimes with oats and bran mixed among the latter．Winter calves are allowed more milk than fummer ones；but they are univerfally allowed new milk，or even to fuck．－In the midland counties bull－ calves are allowed to remain at the teat until they be fix，nine，or twelve months old，letting them run either with their dams or with cows of lefs value bought on purpofe．Each cow is generally allowed one male or two female calves．Thus they grow very falt，and become furpritingly vigorous．The method of the dairy－men is to let the calves fuck for a week or a fortnight accouding to their ttrength；next they have sew milk in pails for a few meals；after that new and fkimmed milk mixed；then flimmed milk alone，or porridge made with milk，water，ground oats，\＆c． fometimes with oil cake，\＆c．until cheefe making com－ mences；after which they have whey－porridge，or fweet whey in the field，being carefully houfed in the night

With regand to the method of fattening cattle，tur－ nips are coming into general ufe throughout Britain． In Norfolk no other method is thought of．The ge－ meral sule is，to allow them to eat their turnips in the field white the weather remains moderately warm，but to give them under cover when it becomes wet or very cold．In this refpect，however，there is a confiderable differchee with regard to thie manner in which the cattle have been brought up；for fuch as have been accuf－ $\mathrm{N}^{\circ} 160$.

In fome experiments by Mr Young，related in the fame volume，he fuccceded Atill worie，not being able to clear his expences．His firlt experiment was attended with a lofs of one guinea per hog；the fecond，with a lofs of its． 8 d ；the third，of only 3 s．In thefe three the hogs were fed with peafe；given whole in the two firft，but ground into meal in the lafl．The fourth ex－ periment，in which the hog was fed with Jerufalem ar－ tichokes，was attended with no lofs；but another，in which peafe were again tried，was attended with a lofs of $4^{\text {s．}}$ Other experiments were tricd with peafe， which turning out likewife unfavourable，barley was tried ground along with peafe and beans．This was attended with a fmall profit，counting nothing for the trouble of feeding the animals．The expences on two hogs were L．14：13：10 $0^{\frac{1}{3}}$ ，the value L．15， 2

I1s，
115. $3^{3}$ 辿. fo that there was a balarice in lis favour of $103.4 \frac{1}{2} d$. In another experiment, in which the hoges were fed with peafe and barley grotnd, the beans being omitted as ufclefs, there was a protit of $12 s .3 \mathrm{~d}$. upon an expence of L. 20:15:9; which our author fuppufes would pay the attendance. In this experimeot the peafe and harley meal were mixed inve a liquid like cream, and allowed to semain in that tate for three weeks, till it became four. This was attended in woolher inflances with protit, and in a third with lofs: however, Mr Young is of opinion, that the practice will nill be found adrantageous on account of the quantity of dung raifed; and that the farmer can thus ufe his peafe and barlcy at home without carrying then to market.

Mr Marfhall remarks, that to the Midand diffriet, oats are preferred to barley as a fond both for young pigs and breeding fows. It is alfo fuppofed that young piga require warm meas to make them grow quickly. Barley.meal and potatoes are ufed in fattering them; beans and peafe being generally difufed.-In this di. Arict it is common to keep two or three pigs in the tly along with the old hogs to be fated. This is done that there may be no walle; as the young pigsluk ont the trough clean when he cld ones are ferved. Mr Mathall obferves, that in a confintd place the old ones are apt to "luid it too much over the litile ones;" for which reafon lie would have a feparate apartment af. figned to them, with a door fo fmall that the large fwine should not be able to get into it.

> Sect.V. Sheep.

## See the artiche Pasterage.

## Sect.M. Rabbits.

Is particular fituations thefe animals may be kept to advantage, as they multiply excecdingly, and require no trouble in bringing up. A confide rable number of them are kept in Norfoik, whete many parts, conlill. ing of barren hills or heaths, are proper for their reception. They del!eht in the lides of fandy hills, which are generally unproductive when silled: but level ground is improper for them. Mr Marthall is of opinion, that there are few fandy or ather book-foiled hills which wouki not pay better in rabbit warrensthan any thing elfe. "The hide of a bullock (fays has) is not worth more than \#, th of his carcate; the 隹in of a fheep may, in full woul. be woth frum a fixth io a tenth of its carcale; tut the fur of a rabbit is worth twice the whole watse of the carcafe; therefore fuppeling a rabbit to confume a quantity of foond in proportion to its carcafe, it $i$, on the principle onicred, a fpecies of fock nearly thre times as valuable as cither cattle or the-p. Rabhit warrens ought to be in. clofed with a flone or fod wall; and at their firlt flocking, it will be neefflary to furm burrows th them nntil they bave time to make them :o thenaflues. Boring the gound horizontally with a large augre is perhapo the beft method that can be practicad. Eagles, kites, and other liards of pre 9 , as well as cats, weatels, and pole-cats, are great enemies of rabbits. The Norfolk warreners catch the birds by thaps placed on the tops of Itumps of trees or artificial tillocks of a coni-

Vol. Vill. Part II.
cal form, on which they raturally allight.- Traps alforouler; \& \& . feem $n$, be the only method of getting rid of the other enemies; though thas the rabbits themfolves are in danger of being caught.

## Sect. VII. Poultry.

Trover there make a pa:t of every hufiomdman', Rock, the keeping of great numbers of them will never be found atended with any adrantage; as it is certain they never will pay for the grain neceffary to fultaill them, if that grain mult be beught. On a farn, therefore, they arc ondy wfeful to pick up what would otherwife be waited; and ceen thas we can only count them profitable at certail: times of the year; and their number mull always be regulated loy the fieze of che farm. -In Ninfolk a great number of tathics are breds of a fize and quality fuperior to thofe in other parts. Mr cirectuman. Marthall accounts for their maner in the followng bere turat manner: "It is undertood in ereneral, that to rearian Nu.titu. turkiey widh fuceefs, it is neceffary that a male berd Mould be kept upon the foot to impergnate the eerg3 fingly ; but the geod houfewives of this comantry know, that a daily intereourfe is unnecefary; and that if the hen be fent to a meighturing cock previous to the feafon of exclution, one act of iarg regnation is funticent for one broal. Thus retiosed from the expence and difagreeablenefs of ketpigg a male bird, nuit litele farmers, and many contagers, rear turkies. This aciounts for their number; and the fpecis and the food they are fatted with (which, I believe. is wholly buck) account for their fuperior lize and quality."

In fome fiuations, particularly in the neighbourhcod poultry of great towns, it might ferhaps be an object to rearerifnot conlide rable numbers of poultry, even though fome part it rive whe of the farm fhould be cultivated merely for their fub. anfined. filkence. It mull, however, be remembered, that poultry cannot bear continemert. They are fpoiled, no: only by being kept in a houfe, hut exen in a yard and its cavirons ; for which reafon Mr loung informs us, that Loord Clarendon con:tantly flifits his poultry through different pares of the park in which they are kep:. In Norfolk it is cuftomary to put young gnlings upongrcen wheat.
Sict. Vhli. Bees.

These may be confidered as of confiderable importance in hutlarare, on account of the unlimited demand there is for honey and wax, and the lixticexpence at which it is obeained. It is nos, however, to be expected, that in all fituations the honey prodrced $0: 3$ will ci:her be in cqual quantity or of equal quatry. nifirmere This depends on the quantity and equality of the flowers or the quanin the neishbourhood to which the bees lare accers the and Thus the loney of Nurfolk is of ioferior quality to that use. produced in other parts; owing, as fome lase fuppofed, to the bees feedin. upon the Rowers of buek wheat, which grows in great quantity throughout the eounty. Mr Marthall. how ever, afcribes its pecin'iar tathe to the heaths and momrilh places :n Norfulk, to which the bees refort, and which feems to be a natural product of the Norfolk fwil. He does not however aftert, that the buck can have no effect upon it: he owns that the buck-howers ate lufcious and difagretable to many
$5 \mathrm{E} \quad$ people; people, though thofe of beans are equally fu to others;
but wifhes that sheir impareing any bad quatity to honer may be doubted, until pofitive proot be brougth to Dice ec:araty.

The Aurdane and Vide of Yorkmirs are remark. a'le for tur quantities of boney they produce ; but it is of au inferter quality, owing, is Mr Marthall fuppofes, to the heath. He cbferves, that in the hives fituated bencen the heaths and cultivated conntry, there is a remarkable difiesence between the vernal and autumnal combs. 'The former, gathered erstircly" from the meacuns, palturelands, trees, and cultivated crops, are in : manar as white as fnow; the latter brown, and the 1.wney ratlicer like meleed rutin than the pue limpid comitence of the fermer. - In the winter of $1-2,2$, a ramorkble nortality tow pace among the bees of this Eing : : wat mabre of hives petiming gadualy. tho I'c: we ho ey remaned. Whe phenomenou oppeared uncen an: ble ; but Mis Aa:fhall exphains it with fome fruhblis, trom a want of what is called lee lered,
 wh.: they do the har $y$ and wor from the nectan arep, itham. The for na cantur be cheaned untif the antlace rebert by the fun which, in the veryculdrany
 of the tum was not oul iery fmall, but the farisa, when once cultecter, was lime to be waflet away by the ruin: Leace, while the bread whinh the bees had collectem! in fram! quantity lafted, whey continued to live; the when this was exhanted, they gratualy prsithed meafer anther; for it is mow univefally al. lowe., , hat withour bee bread the life of thefe infects cannos be fulained, even though whey have prenty of honey

In a paper on the fubject of bees by Mr John lieys, $f$ sovel.s the farima is frymoked to be ufeful for nomming the Mr Kig's young brood, and the honey for the fupport of the old ones: hence, according to the quantity of farina to be procured the flock of bers is linnited. In the place Where lie rfided at the time his letter was wrote (near I'mbioke), no more than cight hives could be kept by a fincle perfon with propricty; but at Chethunt in Herformine, where he refidd before, he could heep 12 or 14 . In his opinion, none but the good frot frams ought to be priterved; the after-fwams fhomid be returned to the lleck, by which means the increafe of liones would be much greater. "A Ancopporated thoch (he lays) will gather more honey than three or four tingle ones." Hives of half a bumbl meature ought to weigh 20 pounds at lealt, and larger hives in propultion; and they oughe not so be above two years of age He laments it as a national lofs, that great gart of the prime fwarms are fuffered to eficape, frons in erroncous upinion about figns and hours of fwarming; " whereas nothing lefs than a confont watching, from feven to four, can prevent this tufs, but which the peafantry will nete ،orply will.". Mr Keys has in vain athenpted to find ans ewty method of fwarming them artificiatly - Fur the gemual method of managing bees, fee the aticles Afis and Eee.

## Sicr. JX. Of the Managment of the Dairy.

As this includes nut only the proper method of pres ferwag milk it in whucfonic and uncormpted tlate, but
the making of butter and cheefe from it, it muy de- Maraze. lervedly be accounted as important a part of habbandry ment of th as any; and accordingly beveral tration have been writen exprefsty up,oi the fuherect.

206
In the fifth volume of Bath Papers, the fuligica feems Dr Ander to be confldered in as accurate and fcicmitio a manner ron's opiby Dr Anderfou as by any perron who lias treated this the makin matter; at leall ats far as te eards the making of butter. The requilites for manufaturng this va'uable commo. dity, according to him, are the howny:

1. To bare cours of a good quality. Is this we are w attend more to the quatity if tican which the mian of a cow yields, than to the ablolute quatity of mils; and this may comanly he joleted of from the thicknefs of it. The finalt Nacracy cows (he lays) aiford the richell milk hithento known; whogh these are many in fividuls of dfficent kindis which afford much richer malk than others; and thefe ought carctality to be fought after, that a good breed may be ellablifiect.
2. To mike the corts yithd a large quantiby of mills. For this parpere they puth have phenty of food; c.ind of all other kinds the Doftor decermines grals to be the bell ; and that grals which furings up ipontareouiny on rich hy liaits to be the bett of all. He is of op nion, hovever, that there is mo virtue in old patares, as maney fuppofe, more than in new ones; and he affures un, that he has fen moch richer butter made from the milk of cous fed upou lay from chover and rye-grafs in the bow fe, than fuch as had liberty to range in old paltures. He think", linwever, that the cows th vuld be permitted to pathure at pleafue during the mornings and evenings, but at noou thould be taken ints a houfe, and fupplicd with fecth food. If aommantiy fed, they thould be milked three times a day; and as great care fhould be taken that his operation be property pafermed, only confisentiai perfons thond be employed. Ite inppoter that a cow well $f$ fed, will give as mach mitk ean time wien milked thrice, as when milked only twice.
3. The qualitics uj the mill iffaj: Theie are reduced by our author to the following aphorifins. 1. Of the mith drunn foum a cow at any time, that which cones fitl is always thimef, and continues to increafo in thinknefs to the very lall doop. 'ithic, as what as ath the fucicdine once, are proved by experimens; and fo great is the inpestance of attending to it, that " the pafon who, by bad milking of hils cows, lofes but half a pinr of his milk, I . fes, in fact, as much cream as would beafforded by fix or eight pints at the beginning, and lules belides that part of the creain which alone cangive richn, fs and high flavour to his butter." 2. Wi.cn milk throws up cream to the furface, that purtion which rifes lifle will be thicker, and of better quality, as well as in prater quantity, than that which rifes in a fecond equal purtion of time. 3. Thick milk throw up a fnisller quantity of cream to the fulface than fuch as is thimes ; but that cream is of a richer quality. If water be added to that thick milk, it will afford a confiderably greater quantity of cream than before, but its quality is at the fame time grcatly debafed. 4. Miak when carried in veffels to any diflance, fo as to fuffer confiderable agitation, never throws up cream for rich, nor in fuch quantity, as if the fame had been put into the milk-pans without ang agitation. From thefe aphorifins, the following cotolianies are deducible. I. The cows ought always

Manare to be milked as near the dairy as poltible. 2. The mer of the milk of different cows thould be kept by themfelves,
Dairy. Dairy. that the good cows may be diftinguihed from the bad. 3. For butter of a very flue quality, the frof drawn milk ought always to be kept feparate from the lat.

Our author now commends the methad ufed by the Highlanders of Scotland, where every cow is allowed to fuckle her own calf. The calves are kept in an inclofure till the time of milking, when they are allowed to come to the door. Each calf there is allowed to fuck its dam as long as the milk-maid pleafes; when it is driven away, and the woman milks the remainder. Thus they obtain only a fmall quantity of milk, but of exceeding grood quality ; and to this practice Dr Anderfon afcribes the richuefs of the Highland butter, which is ufually attributed to the old grafs in the remote glens of the Highlancs. In places where this practice cannot be economically followed, the Doctor recommends to keep the milk which comes firlt, and that which cones latt, feparate from each other. The former might be fold fweet, or made into cheefe. Another ufe our author mentions, viz. ${ }^{208}$ "Take common flimmed milk when it begins to
Sefulpre- turn four; pat it into an upright churn or barsel with one of its ends out, or any other canvenient vefiel; heat fome water, and pour it into a cub that is large enough to contain with eafe the vefel in which the milk was put. Set the veffll containing the inilk into the hot water, and let it remain there for the fpace of one niglat. In the morning it will be found that the milk hath feparated into two parts; a thick creamlike fubitance which occupies the upper part of the veffel, and a thin, ferous, watery part that remains in the bottom: draw off the thin part (called here zuigg), by opening a ftop-cosk placed for that purpofe clote above the bottom, and relerve the cteam for nfe. Not much lefs than the lalf of the milk is thus converted into a fort of cream, which when well made feems to be as rich and fat as real cream itielf, and is only diftinguifhable from that by its fournefs. It is eaten with fugar, and efleemed a great calicacy; and niually fells at double the price of unkimmed milk." 4. Befides feparating the firff from the laft drawa milk, it will be neceflary alfo to take nothing but the cream firft feparated from the beft milk. The remainder of the milk may be employed either in making checfes, or allowed to throw up cream fur butter of an inferior quality. 5. Hence it is plain, that butter of the very beft quality, could be made only in a dairy of confid trable extent, as only a fmall portion of the milk of each cow could be fet apart for it. 6. Hence it appears that butter and cheefe can be made in a confiftency with one another ; the beft nit the milk being fet apart for the former, and the worlt for the latter. But as perbaps no perfon would choofe to give fuch a price for the very beit butter as would indemnify the farmer for his trouble and expence, it may be fufficient to take only the firf drawn half of the milk for cheefe, and ufe the remainder for butter; and the cream of this, even though allowed to fland till it begins to turn four, will always yield butter of a much fuperior quality to that produced in the ordinary manner.

Our author now proceeds to cnumerate the properties of a dairy. The milk-houfe oughe to be cool in
fummer and warm in winter: fo that an equal tem- Mrazeperature may be preferved throughout the year. It mear of the ought alio to be dry, fo as to admit of being t:pp: Dast fweet and clean at ail times. A feparate thilding thould be erected for the puapofe, near a cool fprias or running water, where the cows may liave enfy accel's to it, and where it is not liable in be incommded by ftaguant water. The apatment where the milk Aands flould be well thatcled, have :hick wa!..", and a ventilator in the top for admiting a free circulation of air. There fhould alfo be an apartment with a fre-place and cauldron, for the purpoferffardingand cleaning the veffets. The Doctor is of opinina, that the temperature of from 50.055 degrees is the mo.t proper for feparating the crean from the miik, anil by proper means this might eafily be kept up, or nearly
fo, both fummer and winter.

The utenfits of the daing flomid be all made of $2=0$ wood, in preference either to lead, copper, or even weatiop ps caft iron. Theie metals are all very calily foluble in ivable the acids; the folutions of the two forthighly poifenous: vary! and though the later is infocent, the tate of it mivit render the products highiy difagreeable. The creas:ing dihes, when properly cleaned, fweet, ant cool, ought to be fiited with the milk as foon as it is drawn from the cow, having beer firit carefully ftrain:d through a eloth, or clofe Etrainer made of hair or wire: the Duetorprefers ilver wire to every , hher. The creaming cifhes onethe never to exceed three inches in depth ; but they may be fo bruad as to contain a gallon or a gallon and an half; when filled they outhe to be put on the fhelves of the milk houfe, and winain there until the cream be fully feparated. If the: finett butter be intended, the milk uta hit nos to tlant above fix or cight hours, but for ordinary bater it may thand twelve hours or more ; yet if the dainy the very large, a fufticient quantity of cream will be fephrated in two, three, or four hours, for making the beth butter. It is then to be taken off as nicely as polfile by a frimming-dih, without lifting any of the milk; and immediately after put into a vefill by ittho untila proper quantity for churning be collected. A firn, neat, wooden barrel feems well adapted for this parpore, open at one end, and laving a lid utted to chote it. A cock or fpigot ought to be lised neat the be:tom, to draw of any thin or ferons pirt which may drain from the crearn; the infide of the opening thould be covered with a bit of fine filver wire gauze, in order to keep baek the cream while the fentum is allow. ed to pafs; and the barrel thould be inclined a little on its lland, to allow the whole to run off.

The Doctor contradicts the opinion that very line crent butter cannot be obtained, except fiom ciean that is creath to not above a day old. On the contruiy, he infils that b-k=1t it is only in very few cafes that even tolerably grod tave nape butter can be obtained frum cream that is nut above wethe eat one day old. The feparation of butter from ercam buthen: nato only takes place after the cream has attinned a cer. tain degree of acidity. If it be agitated before that acidity has begun to take place, no butter can be ob. tained, and the agitation mult tecontinned till the time that the foumefs is prodncol: after which the butter begins to form. "In fumener, whits the climature is warm, the heating may bee, withone bet; much difficulty, continued ameil the actuly be ?

$$
5 \mathrm{E}=
$$

Manace duced, fo that butter may te got: but in this cale mese of the the frocefs is ong and tedious; and the butter is for D. $125^{\circ} \mathrm{F}$
:12
Of the
c!..: $:$. the mort pait of a foft conaitence, and tough and glvey to the total. If this proceds be atcempted durng the cold werther in winter, butter can farcely be in any way ohtained, unkers by the application of fome great dester of heat, which fumetimes affits in funducing a very inferior kint of butter, white, hard, and brithe, and amot untit for any culinary purpole whatever. 'The jadicions farmer, therefore, will not attempt to imitate this practice, but whll allow his crean to remain in the vellel appropriated for keeping it, until it has acquired the propar degree of acisity. There is no rule for deiermang low lons it is to be kspt; but ous muthor is of opinion that a very great latitude is allowable in this cale; and that it nu ferous matior be alhowed tes lotge amona the cream, it may be kept goon for makine butter a great many weeks

The charn in which butter is mane likewite admits of coniderable disertity ; but ou: author prefers the old.futhioned upright churn to all others, on accomat of is being more satily cleaned. The labour, when the aedm is properly prepared, he thinks, very trithing. Wuch greater nicety, he fus, is required in the procols of charning than moth people are aware of ; as a few ha!ty and irreguiar ttrokes will render butter - bad, which otherwife would have been of the fine it quality. After the proces is over, the whole onght to be leparated from the milk, and put into a clean dith; the intide of which, if made of wood, ought to be well rubbed with common falt, to prevent the butter from adhering to it. 'The butter hould be prefled and worked with a that wooden laddle or thimming dith, having a frort handle, fo at w poree out all the mulk that was lodeed in the cavities of the mats. This operation requites a confiderable degree of itrength as well as dexterity; but our author condemns the besting up of the butter with the hand as "an indelicate and barbarons praciice." In like manner he condemns the employing of cold water in this operation, to wath the butter as it is called. Thus, he lays, the quality of it is debafed in an attonihing degree, If it is ton coft, it may be put into imall vellets, and thefe allowed to fwim in a tub of endd water: but the water ought never to touch the butter. The beatiog frould be coatinued till the milk be thoroughly feparated, but not till the butter become tough and gluey; and after thi ; is completely done, it is next to be falted. 'lhe veffel into which it is to be put mult be well fealoned with boiling water leveral times poured int it: the intale is to be rubbed over with common falt, and a little nelted butter pourd into the cavity betuen the bottom and lides, fos as make it even with the buttun, and it is then fit for receiving the butter. Intead of common falt alone, the Doctor re-
covered with a piece of linen, and over that a piece of Namage. wet parchment ; or in defect of this latt, fine linen ment of th that has been dipped in melted butter, exactly fitted $\underbrace{\text { 1)arv. }}$ to the edges of the velfel all round, in order to exclude the air as much as polfibie. When quite full, the calk is to be covered in like manner, and a little melted butter put round the edges, in order to fill up effectually every cranny, and totally to exclude the air. "If all this (fiys the Doctor) be carefully done, the butter may be kept perfectly Gound! is thes climate for many years. How many years I cannot tell; but I have feen it two years old, and in every refpect as fwest and found as when c.nly a month old. It deferves to be remarked, that butter cured in this manner does not tatke well thll it has flood at lealt a fortnight alter being falted ; but after that period is elypfed, it eats with a rich marrowy talle that no other butter ever acquires; and it talles fo littie falt, that a perfon who had been accutomet to eat butter cured with commen falt only, would not imagine it had got onefourth part of the fats neceflary to preferve it." Our auth ir is of opinion, that itrong brine may be ufeful to pour upon the furface during the time it is uning, in onder the more effectually to preterve it from the ain, and to awsid rancidity.

As butter contains a quantity of mueilaginous matter mach more putrefcible than the pure oily part, our author recommends the purifyng it from this muci- wango lage, by meking in a conical veffel, in which the muci-mates.
lage will fall to the bottom; the pure oily part fwimming at top. This will be ufeful when butter is to be fent a long voyage to wa:m clinates, as the pure part will keep much better than when mixed with the preferved other. He propofes another methol of preferving Preferved butter, wiz. by mixing it with honsy, which is very antifeptic, and mixes intimacely with the butter. Thus mixed, it eats very pleafantly, and may perhaps be fuccefsfully ufed with a medicinal intention.

The other grand object of the dairy is cheefe- ${ }^{217}$ making, which in fome counties of England becomescheef. a very confiderable aricle. In this the fame precaution is to be obferved as with regard to butter; wie. the milk ousht not to be agitated by carrying to any diftance; nor ought the cows to be violemtly driven before they are milked, which reduces the milk almolt to the fame itate as if agitated in a barrel or churn. To this caufe Mr Twamley, who has written a treatife upon dairy management, attributes the great difficulty fometimes met with in making the milk coagulate; four or five hours being fometimes neceltary intead of one (the ulual rime employed) ; and even after all, the curd will be of fuch a foft nature, that the cheefe will fwell, puff up, and rent in innumerable places withous cver coming to that folid cunfitence which it ought to have. As this frequently happens in confequence of heat, Mr 'Twamley advifes to mix a little cold fpring-water with the milk. It is a bad practice to put in more rennct when the curd appears diffecult to be formed; for this, after having once formed the curd by the ufe of a certain quantity, will dilolve it again by the addition of mote.

The molt cummon difcess of clicefe are its appear- fenerald of ing when cut foll of fmall holes called eyes; its pufting chenf. up, cracking, and pouring out quantities of thin lerous
commentis the fulloning compolition. "Take of fugat une part, of nitre one part, and of the bett Spanifh great falt two parts. Leat the whole into a fine powder, mix them wall iogether, and put them by for ufe. Orit annce of this is to lie thoroughly mixed with a pound of butter as foon as it is freed from the milk, and then immediatcly put into the veflel defigned to hold it; after which it mult be preffed fo clofe as in 1:abe no ais.hules; the furface is to be fmoothed and

Mansge- liquor: becoming afterwards rotten and full of magnent of the gots in thofe places from which the liquor iffued. All this, according to our anthor, proceeds from the furmation of a fubltance called by him fip curd, a kind of half coagulum, incapable of a thorough union with the true curd, and which when broken into very fmall bits produces eyes; but if in larger pieces, occalions thone rents and cracks in the cheefe already mentioned; for though this kind of curd retains it conghated oature for fome time, it always fooner or later diffulers into a ferous liquid. This kind of end may be produced, 1. By uling the milk too loot. 2. 13y bad runser. 3. By not allowing the eurd a proper stime whom. The Gret of thefe is remodicd by the ufe of coll water, which our anthor fays is for far from bein cicerimental to the quality of the clecere, that it really promotes the action of the rts wet upon the miik. The fecond, ziz. a knowtedge of ;ood from bad rannet, can only be acquired by long practice, and no particular directions can be given, farther than that the utmont carc muft be taken that it have no putid tendency, nor any rancidity from ton great heat in drying. The only rule dat can be given for its preparstion is to take out the maw of a calf which has fede entirely upon milk; after it is cold, fwill it a little in water; rub it well with falt; then fill it with the fame, and afterwards cover it. Some cut them open and fipead them in falt, putting them in layers above one another, let. ting them continue in the brine they produce, fometimes flirring or turning them for four, fix, or nine months; after which they are opelted to dy, fireteh. ed out upon lticks or fplints. They may be uled immediately after being dried, though it is reckoned bell to keep them till they be a year old before they are uled. The bett method of making the runnet from the fkins, according to our author, is the following: "Take pure Spring-water, in quantity proportioned to the runnet you intend to make; it is thought beit by fome two flkins to a gallon of water; band the water, which makes it fofter or more pure; make it with falt into brine that will fwim an egg; then let it dand till the heat is gone off to about the heat of blood-warm; then put your maw-lkin in, either cut in pieces or whole; the fonmer l thould imagine belt or mol convenient; letting it Atep $2+$ hours, after which it will the fit for wie. Sach quansity as is judged neceftary mut then be pui into the milk; about a tea cupful heing neceflary for ten cows milk; though in this refpect very particular dircetions caunot be givon."

In the Bath Papers, Mr Hazarl gives the following receipt for making runnet. "When the maw dita is well prepared and fit for the purpole, three pints or two quarts of feft water, clean and fweet, thould be mixed with falt, wherein thould be put fweet brier, rofe.leaves and flowers, cinmon mace, cloves, mace, and in thort alnof cerry fort of fpice and aromatic that can be procured; acel if thefe are put into two quarts of water, they mutt boil gently till the liquor is reduced to three pints, and care thould be taken that this liquid is not fmoksl; it th suld be ftrained clear from the fices, \&ec. and when found not to be warmer than milk from the cow, it flould be poured upon the rell or maw; a lemon may then be dliced into it,
when it may remain a day or two; afice which it Bumac. mould be trained again and put inta a buete, where if mestot the weil curked it well koep gond f:r twelve montho or more; it wili fmenl like a permome, and a fmall quattity of it will tum the mille and give the elieefe a pleatine flavour." He adds, that if the vell or mas be falted and dried for a weets or (wo near the bive, it will do for the purpose ag ita alomolt as well as beturc. (1)+ry. In the making of checfe, furloung the ramet to be of a grond unaicy, the followior pa-acolars mupo vat be obferved: 1. The proper derree of heat. TVisi, "hateg of onglit to Le what is called! mike:s:arm, or "a few decrees remowed from coohef." aceordinit 1 , Nir 'l"wankey; confiderably below the heat of milk taken from the cow. If too hut, it nay be reiduced to a proper temperature by cold watcr, as already mentioned. z. The time allowed for the rano: to take effect. 'Phis, wor author obferses, ought never to be kifs than an hur and a halt. The procefs may be aceslerated, paticutarly by putring falt to the milk before the runnet is adeded. Mr l'wamley adviles two handfuls to cen or twelve cows mik; but he affures us, that no bad confequence can follow fre:n the curd being fornied ever fo foon; as it then only becomes more fulid and tis fur making checic of a projeer quality. 3. To present any difheulty in feparating the curd from the whey, prepare alng cheefe knife from lath; one edre being tharpened so cus the curd acrufs from top to bottom in the tuh. erulling it with lines checkenwife: by which means the whey rifes throush the vacancies made by the knife, and the curd finks with much more cale. A ficese has alfo been ufed with fuecefs, in order to leparate the whey periectly from the cuid. H. Having got the curd all firm at the bottom of the tub, take the whey from it; let it tland a quarter of an hour $t o$ drain hefore yon put it into the vat to brcak it. If any bits of lip-curd Fwim among the whey, pour it all off together rather than put it among the checfe, for the reafons already given. Some dary-women allow the curd to lland for two horns: by which time it is becone of the tirm a nature, that no breaking is need fary : they inve oniv to cut it in thices, put is into the vat, and work it weit by fusezug throughty to make it lit chole: then put it into the prets. On author, however, appro es more of the methol of breaking the curd, a, leca apt to make the choele hard and harny. 5 . When the whey is of a white colour, it is a certan tign that the curd has not fubliced; bat if the coethod jult now laid down be fullowed, the whey will alway be of a green coluur; indeed this colour of the whey is alway in cestain criterion of the curd having hes a pioperlynamaged. 6. "Me bett me:hat of preventing checfe fram heaving, is to avend making the runnet tho thong, to take care that it be elcan, and not talited: $t 0$ becertain that the curd is fully enene, and not to thir is belure the air has had time to elcape; a quantity of air lreing always dif. charged in this as in many other chomical pricetes. 7 Cheere is very apt to fplit in conterpence of being. "falted.within," efpecially when the sat is about halit folled. In this cafe the curd, though feparated undy in a fmall degree by the falt, never cloles or jeins as it ought to do. AIr Twamley preters falting in the mith greatly to this method. 8. Diy cracks in checefe are before

1'mir I.: senerally produced br keeping curd from one meal to another, and letting ihe firt become too lliff and hard before it is mixed with the other. S. Curdly or wrinkle-c asted checfe is c.ufed by four milk. Checfe made of cold milk is apt to be hard, or to break and Hy befure the knife. 10 . Such coasted cheefe is caufed by beine made too coll, as cheefe that is made in winter or ite in antumn is api to be, unlefs laid in a warm room after it is male.

Cheefe is of very diffrent quality, according to the milk from which it is made: 'Thus, in Clrucetlerfhire, what is called the fiount or tuos-mad cheefe, is made from one meal of new malk ant one of Nkimened or old milk, havine the cream taken away. wimmed cheefe, or tht mitk cheefe, is made entirely from kimmed milk, the cream hasius been riken of to make butter. It gots be the mane of sumble chefe, and is much ufed at fea; heing le's liable to be affected by the heat of warm climates than the other kinds. A great deal of difference howerer, is to be obferved in the quality of it, which nur nuthor fupp fees to arife chiefly from greater care beine taken in fome places than in others.

Shi, conat or fof cheefe is made entirely of flip.curd, and riffelves inco a kind of creany liquor ; which is a Semmoration of the nature of this curd as already mentioned. It is commonly computed, that as much milk is required to make one pound of butter as two of cheefe; and even more where the land is poor, and the pathures afford but little cream. - For further particulars with regard to thefe two commoditics, fee the articles Butria and Caeese.

## Sect. A. Making of Fruit-Liquors.

Thfsf, as objects of Britifh hufandry, are principally two, Cyder and Petry; the manufactuing of which forms a capital branch in our fruit-counties, and if which the improvement mult be confidered as of great importance to the public, but particulanly fo to the inhabitants of thefe diftricts where thefe liquor conftitute their common beverage.
 fers. tainly far mose whulefome than many others which at prefent are in much higher eftimation. When the mult is prepared from the choicelt froit, and undergors the exact degree of vinous fermentation requifite to its perfection, the acid and the fwet are fo admirably lhended with the aqueous, oily, and fpirituns principles, and the whole fo imbued with the Erateful flavour of the rinds, and the agreeable aromatic bitter of the kernels, that it affumes a new character: grows lively, fparkling, and exhilarating : and when cornpletely mellowed by tine, the liquor becomes at unce highly delicious to the palate, and congenial to the conlfitution; fuperior in every refpect to mott other Englih wines, and perhaps not inferior to many A Buth $P_{a}$ of the bett foneign wines. Such (fays 1)r Fothergill $\dagger$ ) jers, vol. w. would it be pronounced by all competent jundiges, were 5. 343 . it not for the popular preindice annexed to it as a cheap home-brewed l quor, and confequently within the reach of the vulgar. To compare fuch a liquor with the fortign liery fophinicated mistures often imported under the name of winee, would be to degrade : : for
it certainly furpafies them in flavour and pleafantnefs, Fruit. as much as it excels them in wholefomenefs and cheap. qun nefs. But rarely do we meet with perry or cyder of this fuperior quality. For what is generally fold by dealers and inn-keepers is a poor, magre, vapid liquor, prone to the acet us fermentation, and of courfe very injurions to the conttitution. Is it not very mor-Are of tifying, after the experience of fo many centuries, king th that the art of preparing thofe ancient Britith liquors not yes Gould Itill be fo imperfettly underitood as yet to feem to derfor be in its very infancy ? - That throurhout the principal cyder diftricts, the practice fhould ltill reft on the molt vague indeterminate principles, and that the excellence of the liquor fhould depend rather on a lucky random hit, than on good management! Yet fuch appears to be teally the cafe even among the molt experienced cyder-makers of Herefordhire and Gloucefterlhire.

Mr Marflall, that nice obferver of rural affairs, in his late tour * through thofe counties (exprefsty unl- Rurc dertaken for the purpofe of inquiry on this fubject), con. of informs us, that fcarcely two of thefe profethonal ar- inferfor tilts are argreed as to the management of fome of the it. p. ? moit eilicutial paits of the procefs. That palpable er-Errors rors are committed as to the time and manner of ga- painte thering the fruit-in laying it up-in neglecting to out. feparate the unfound-and to grind properly the rinds and kernels, \&c. That the method of conduating the vinous fermentation, the mot critical part of the operation, and which ftamps the future value of the liquor, is by no means afcertained: While lome promote the fermentation in a fpacious open vat, ottiers reprefs it by incloling the liquor in a hogthedd, or flrive to prevent it altogether. That no determinate point of temperature is regarded, and that the ufe of the thermometer is unknown or neglected. That they are as little confitent as to the time of racking off; and whether this ought to be done only once, or five or lix times repeated. That for fining down the liquor, many have recourfe to that odious article, bullock's blood, when the intention might be much better anfwered by whites of eqgs or ifinglafs. And, finally, that the capricions tatte. of particular cuAtoncrs is gencrally confulted, rather than the real excellence of the liqur: and confequently that a very imperfect lipuor is often vended, which tends to reduce the plice, to difgrace the verder, and to bring the wie of cyder and perry into difrepute.

The art of making vinous liquors is a curious chemical procefs; and its fuccefs chictly depends on a dexterous management of the vinous fermentation, belides a clofe attention to fundry minure circumflances, the theory of which is perhaps not yer fully underitood by the ablef chemifts. Can we longer wonder then that fo many errors hould be comnitted by illiterate cydermakers, intally unceried in the firlt principles of the clatnical art? Some few, indeed, more enlightened than their brethren, and lefs bigotted to their own opinions, by diut of obfervation Itrike out improvements, and produce every now and then a liquor of fuperior quality, though perbaps far fhort of excellence, yet Itill fulficient to fhow what might poffibly be accomplifhed by a feries of new experimemrs conduceed on philufophical principles. Thas might lead
ruit Li- to fucceffive improvements, till at length our Enelifh quo:- fruic-liquess might be carried to a pitch of perfection hithert. unknown, by which the deraant, both at home and auroad, would foom be eal. rged, the prices augmented acecrding to the qualiey, the watue of effates increafed, and oloc hetalh and Speproity of thefe countics fupontionally acianten!. This anight alfo belp to print out a nethod of concearge the imperfectinns of thefe lionore: ane! of mrliwating thefe of a wealk meagre quality, liw fafe and mose effectual means than are nuw precitif. (: and thongh mothing can fully congerfate the dafrit of funNine in maturigs the facharite : wiecs in unfavourable feafons, yot prokwhly fuch lifuor might, without the dangerche and crapreve rectlud of buthing in a copper velfel, admit of chadrabie imperveratht by the adition of thina on other fuaterts foment, as yet unknown in the practice of the cyder dithicts; or perlaps rathe: by a portion of rich tont, or fome wholefome fiwet, as luney, fugap-andy, or even anelaftes, aded in cus proparien, presions to the fermentation. In fact, it apmears fromalate phitationf, that the Germans are known to meltomete their thia harth wines by an addition of wocerthited math, nut by evaporation, but by foraing. Diy this limate procis they are made to chalate sum? Fienich wines; a prac. tice worthy of imitation, ofrecially in the morthern climates.

Cyder, as is well hamw, is nace from apples, and Perry from pears wily. Tlee actiecal methed of preparing both thef liquos is very much the lanic: and wrier the anticle (rober a defeription is given of the way in which thofe fruits are a wheted, rround, andprefind. Itie will is not extroizaly hiff rent fom that of a commen tanner's mill for griming bark. It conds la of a milh. ftome from : wo and an half whour fet and an hati in diameter, soming on itsedge in a circular 1 d $n=$ trough, from nine to tweive incles in thickneis, and from one to two tuns in weigh. The bothm of the trough in which this flowe runs is fumewhat wider than the thicknefs of the fone ivielt ; the innes ide of the growe
 manner as to make the top of the trough fix or eight inches wider than the buthors; ty which means thite is room for the lione to run fredy, and likewife fur putting in the fruit, and firming it iop while grinding. The bed of a midule-fized m'll is about 9 fect, fome 10, and fome 12; the whole being comporded of wo, three, or fuwr thones cramped together, and finithed afier being coampect in this manner. The bett itenes are found in the forest of Dean; generally a dark. red. difh grithone, not caicarenus; for if it were of a calcareous quality, the acid juice of the fuits wowh act upon it and Spoil the ligeor: a clear-grained grabdtone grit is the fittent fat the purpoíe. The runrer is moved ly means of an axic falling through the contre, witha long arm reaching without the beed of the mill, for a horfe to dravety ; on the other lide is a therter arm fafling through the centre of the llune, as reprefented in the fagure. An iren bot, with a large ficat, pafies through an cye, in the twer fatt of the lima on which the dolic turns, into ake and of the in. ier am of the axis; ardina the dable nosivit of it is ub-
tained, and the fone kept perfetty upright. There fout tho ought alfo to be fixed on the inner arm of the axis, ywor* about a foot fom the runner, a corsed wheel workir. in a cirele of cogs, fixa woon the bed of di: mull.
 which it is apt to do when the mit is full ; is lisewit? makes the werk more caty tor the horte. "1h,
 Marthall cherves, that it is an error to nrike the ho fe draw by traces: "The acting point of dratert (fors; he), the hore's thoulder, ousht, tior variona reafon, io be apritid immediatery at the end of the arm of tat:

 fo: wite be:aist the mill and the walls: that a nit!dinur-lize: I mill, wifl its horle-path, whes up a
 fions withe rath h a a arourling to mur authan, wo
 oughe io have a fuor thrumb over it at the hatite of feven fict: with al dunt in the usidel. of be frami. and a window oppofie, wuh lise nall on wie fole and the prefes on the wher fole of the winds. Ins la'ter malt be as near the mall as convenience wiil allow, for the noore ealy conveying the ground fosie from the are to the other. "Ihe prets, of whach the principle will he maderllond from the hgure, hav ir beet or hottom alout five feer fquare. 'Alis englit en be made entirely either of wood or thone; the practice of concolare it wita lead beang now maivernally knowa to be pernicions. It has a channel cut a lew in bes within its outer égen, to catch the liguor as $i t$ is exprefied, and convey it to a lip formal by a progectan on that dide of the bed opecite to the mill: howing under it a fane trongh or wooden vefict, tank within the ground, when the bed is bined luw so receive it. The prets is wothed with livets of difterent lomgiles; firf a more, and then a moletately loms onc, buth worked by hand; and latly, a tal eight of mite fict long worke by a capllanc or wimblafo. The ale ene of citsing un a mill-honte is nos very grat. Mo Narthall computes it fiont 201 . to $z, 1$. allal, an a fratl fesle, from icl. 1015 . though much depends on the dallance and carriage ot the thonc: when olle fitted up, it willall many years.

The making of the fruit liguors under confidera. tion requires an attention the following particulars. 1. The frait. 11. The grinding. Il: Prefo fing IV. Fermentog. V. Correturg. VI. Laying up. YII. Bosting: each of whech heals is tuber. wed into feveral uthers.
 ticulars are to be emfidet. $n$ ed ofles 1. The time of gathering ; which vaies accurdingisut. to the nature of the follo. The early pears are hio for the mill in septertber: hut tew apples are wady fur gathering hefore Dichal Inas; thengh, Ly reafon of accidental oncumbances, they are frequmbly mantatured twhe that time. For fale cyate, and keeping drak, why an hoterd th hang upon d:e tices the Suity Hger ahd the midd of Ocio-
frat 1 . Ler is generally looked upen to be a proper time forga1\%. F. thering the the apple. 'Pbe coterion ot a due degree
of henefs is the frut falling fiom the trec: and to force it away before that tinnc, in Mr Marfall's opinion, is robbine it of fone of its mot "aluable particles. "I'he haredting of fruit (fyshe) is widely diferent in this redeet from the harvetting of gran; which has the entire phant to Eeed it after its feparation from the foil; while frait, after it is fevered from the tree. is cent ofl from all pombility of a further fupply of monithonent: and althougt it may lone reacled its wonted fae, fome of its mure efintial partictes are undoubtedy loft be hind in the tree." Sometmes, howeve, the fruis which are late in ripening are apt to hang on the tree until poiled by frolls: though weak watery fruits feem to be mont ingured in this manner ; and Mr Mande:ll relates an intance of very finc liquo beine made from goblen pippins, after the fruit had been fueen as hard as ice.
2. The method of gathering. 'This, as generally practifed, is dircetly contrary to the principle lad dow in by Mr Marhall, viz. beating them down with lung flonder poles. An erident difadantage of this method is, that the frut is of un qual ripenets; for the apples on the Came trees will difer many days, perhaps even weeks, in the ir time of coming to perfection ; whence fome pant of the richnefs and flavour of the fint will be effectually and irremediably cut off. Nor is this the only evil to be dreaded ; for as every thing depends on the fermentation it has to undergo, if this be interrupted, or rendered complex by a mixture of ripe and unsipe fruits, and the liquor be not in the firt infance futheiently purged from its feculencies, it is dificult to clear the liquor afterwards. The former defect the cyder makers attempt to remedy by a mixture of brown fugar and brandy, and the latter by bullock's blood and brimfone; but neither of thefe can be expected to anfwer the purpose very effectually. The bell method of avoiding the inconveniences arifing from an unctral ripening of the fruit is 10 go over the treestwice, once with a hook, when the fruit begins to fall fpontaneouny; the fecond time, when the latter ate falheiently ripened, or when the winter is likely to tet in, when the trees are to be cleared with the poles above mentioned.
3. Maturing the gathered fint. 'This is ufually done by making it into heaps, as is mentioned monder the articie Cynfr: but Mr Marhall entirely difapproves of the practice; becaufe, when the whole are laid in a heap together, the ripelt fruit will begin to rot before the other has artived at that degree of artificial ripenef; which it is capable of acquining. "The due degree of maturation of fruit for liquor (he obferves) is a fubicet about which men, ceen in this diffict, differ much in their ideas. The prevailing practice of gathering into heaps until the ripeft begin to ret, is wafting the beft of the fruit, and is by no means an accurate critesion. Some thake the fruit, and judge by the ratting of the kumels; cthers cut through the middle, and judge by their blacknefs; but none of thefe appear to be a proper teil. It is net the thate of the kernels bat of the fieb ; mot of a frw individuals, but of the greater part of the prime-fant, which rendes the collective body fit or unfit to be fent to the mill. The moll rational tett of the ripencls of the fruit, is that of the fede $\mathrm{N}^{\circ} 160$.
haning acquired fuch a degree of mollownef, and its Frait 1 texure fuch a derree of tendernefs, as to yich 10 moderate preflime. Thus, when the hasckle ur the end of the thamb can with moderate exerton be foreed into the pulp of the finit, it is deemed in a lit 体ate for grinding."
4. Preparation for the mill. The profer management of the futu is tokeep the ripe and ansipe frosit teparate from each of har : but this cannot be done with. out a confiderable degice of labour; for as by numberItfs accidents the ripe and unipe fruits are ferguently coufounded together, there cannot be any effecthal methor of feparating them except by hand; and Mr Marthatl is of opinion, that this is one of the grand fectets of cyder-making, peculiar to thofe who excel in the butheds; and he is fuprifed that it fhould not before this time have come into common practice.
5. Mixing fruits for lquor. Oul author fecms to Coubt the propriety of this practice; and informs us, that the finer liquors are made from Celect fruits; and he hints that it might be more proper to mis liquars after they are made, than to put together the ciade fruis.
11. Grint:rg, and management of the fruit when Griadin ground.

1. For the greater convenience of purting the fruit into the mall, every mill-houfe fhould have a fruit chamber over it, witha thap door to lower the fruit down into the mill. The bett manner in which this can be accomplithed, is to have the valve over the bed of the mill, and furnifned with a cloth pont or tunnel reaching down to the trough in which the fone moves. No ttraw is ufed in the lofts, but fometimes the fruit is turned. In Hercfordthire, it is generaily believed, that grinding the rin! and feeds of the frut as well as the flefhy part to a pulp, is neceflary towards the perfection of the cyder ; whence $i t$ is neceffary, that every kind of pains thould be taken to perforin the grinding in the moft perfect mamer. Mr Marthall complains, that the cyder-mills are fo imperfectly finifhed by the workmen, that for the firft fifty yatrs they cannot ferform their work in a proper manner. Intead of being nicely litted to one another with the fquare and chiffe!, they are hewn over with a rough tool in fuch a carelefs manner, that horfe-beans might he in fafety in their cavities. Some even imagine this to be an ad vantage, as if the fruit was more effectually and completely broken by romg than fimooth titnes. Some we fluted rollers of iron ; but thefe will he corroded by the juice, and thus the liguor might be tinged. Smooth rollers will not lay hold of the fruit folficiently to force it through.

Anotiner improvement requifite in the cyder-mills is to prevent the matter in the trough from riting before the tlone in the laf tlage of grinding, and a method of thirring it up in the trough more effectually than can be done at prefent. 'I'o remedy the former of thele defects, it might perhaps be pooper to grime the fruit firt in the mill to a certain degree; and then put it between two fmooth rollers to finith the operation in the moft perfect manner. It is an errur to grind tow much at once; as this clogs up the mill, and prevents it from going tally. The ufual quatity for a middefized mill is a bag contuining; [uar corn bufhels: but our author had once an orportunity of fecing a mill

Fruit. Li. in which only half a bag was put; and thus the work qua fecmed to go on more eafly as well as more quickly than when more was put in at once. The quantity put in at one time is to be taken ont when ground. The ufual quantity of fruit ground in a day is as much as will make three hogheads of perry or two of cs. der.
2. Management of the ground -fruit. Here Mr Marfall condemns in very flong terms the practice of prefing the pulp of the fruit as foo as the grinding is finimed; becaufe thus neither the rind nor feeds have time to communicate their virtues to the liquor. In order to extract theine virtues in the moll proper manner, forme allow the ground -fruit to lie $2+$ hours or more after grinding, and even regrind it. in order to have in the moll perfect manner the favour and virtues of the feeds and rind.
III. Profiling the fruit, and management of the re. fidurm. This is done by folding up the ground fruit in pieces of haircloth, and piling them up ab we one another in a fquare frame or mould, and then pulling down the pref upon them, which fquezes ont the juice, and forms the matter into thin and almond dry cakes. The fort runnings come off foul and muddy: but the lat, especially in perry, will be as clear and fine as if filtered tho' paper. It is common to throw away the refiduum as afters; fometimes it is made ore of when dry as fuel : fometimes the pigs will cat it, copecially when not thoroughly fqueezed; an al fometimes it is ground a fecund time with water, and fqueczed for an inferior kind of liquor unfed for the family. Mr Marfhall advifes to continue the preflure as long as a drop can be drawn. "It is found (fays he), that even by breaking the cakes of refuse with the hands only gives the prefs fret power over it; for though it has been preffed to the lat drop. a gallon or more of additional liquor may be got by this means. Regrinding them has a fill greater effect: In this date of the materials the mill gains a degree of power over the more rigid parts of the fruit, which in the frt grinding it could not reach. If the face of the runner and the bottom of the trough were defied with a broad chifley, and marie true to each other, and a moderate quantity of refiduum ground at once, fearcely a kernel could escape unbroken, or a drop of liquor remain un. drawn."

But though the whole virtue of the fruit cannot be extracted without grinding it very fine, lome inconvenience attends this practice, as part of the pulp thus gets through the hair cloth, and may perhaps be injurious to the futfequent fermentation. This, however, may be in a great meafure remedied by flaaining the fort running through a fieve. The whole fhould aldo be allowed to fettle in a cali, and dawn off into a frefh veffel previous to the commencement of the fermentation. The reduced fruit ought to remain forme time between the grinding and prefling, that the liquor may have an opportunity of forming an extract with the rind and kernels: but this nail not be puts. ed too far, as in that cafe the colour of the cyder would be hurt ; and the moll judicious managers object to the pulp remaining longer than 12 hours without preffure. "Hence (fays our author), upon the whole, the mol eligible management in this Huge of the art appears to he this: Grind cine prefsful a -day; pref o Vol. VIII. Part II.
and regrind the refiduum in the evening ; infuse the reduced matter all night among part of the fire runrings; and in the morning re profs white the next prefeful is grinding.
IV. Fermentation. The common practice is to lave Fermeriz. ${ }^{2,3}$ th: liquor turned; that is, put into calks or berg- tors. freded immediately from the pref, and to fill them quite full: but it is undoubediy more proper to leave forme face empty to be filled up afterwards. No ac. curate experiment has been made with regard to the temperature of the air props to be kept up in the place where the fermentation goes on. Iroll is pre. judicial: but alien the process ufually commences, that is about the middle of October, tin liquor is put into airy fades, where the warmth is farce greater than in the open at mofplicre; nay, they are frequentIs expufed t, the open air wit act any covering farther than a piece of the or flat tone over the bung-hole, propped up by a wooden pin on one fide to caudle the rain water run off. In a complete manufactory of fruit -I quot, the fermenting room thould be under the fame roof with the mill house; a continuation of the prefs.room, or at leaf opening into it, kith windows or doors on every fade, to give a free admission of air into it; lisficiest defences against front; fruit -lofts over it, and vault underneath for laying up the l quors after fermentation; with mall holes in the crown of the arch to admix a leathern pipe, for the purnofe of conveying the liquors occalionally from the one to the other.

In making of fruit liquors, no ferment is unfed as in making of beer; though, from Mr Marmall's account of the matter, it teems far from being aneceffary. Owing to this omiffiun, the time of the commencement of the fermentation is emirely uncertain. It takes place Come times in one, two, or three days ; fometimes not till a week or month after mining: but it has been ubferved, that liquor which has been agitated in a carriage, though taken immediately from the press, will fonmetimes pals aloof immediately into a tate of fermentation. The continuance of the fermentation is no lefs uncertain than the commencement of it. Liquors, when much agitated, will go through it perhaps in one day; but when allowed to remain at reft, the fermentation commonly goes on two or three days, and fonctimes five or tiv. The fermenting li. quot, however, puts on a different appearance according to circumfances. When produced from fruits properly matured, it generally throws up a thick fum refenbling that of malt liquor, and of a thick refs proportioned to the facies and ripeness of the fruit; the riper the fruit, the more form being thrown up. lew gives but little form, and eyer will fometimes aldo do the fame; fume times it is intentionally presvented from doing it

After having remained forme time in the fermenting veficl, the liquor is racked or drawn off ir $m$ the lees and put into frefle calks. In this part of the operaton alfo Mr Marmall complains greatly of the lite attention that is paid to the liquor. The ordinary time for racking perry is before it has done hiftug. or fonetimes when it begins to emit lisa air in plenty. The only intention of the operation is to free the ligur from its feces by a cock placed at a little illance from the bottom; after which the remainder is to be 5 E filtered

Fruit-I, filtered through a canvas or flannel bag. This filtered quer.: liquor difiers from the relt in having an higher colour ; having no longer any tendeacy to ferment, but on the contrary checking the fermentation of that which is racked off; and if it lofes its brightnefs, it is no lunger eafily recovered.-A freth fernentation ufually commences after racking; and if it become violent, a frelh racking is neceflary in order to cheek it; ir confequence of which the fame liquor will perhaps be racked five or fix times: but if only a fmall degree of fermentation takes place, which is ealled fretting, it is allowed to remain in the fame cafk; though even here the degree of fermentation which requires racking is by no means determined. Mr Marthall informs us that the beft manufacturers, however, repeat the rackings until the liquor will lie quiet, or nearly fo ; and if it be found impracticable to accomplifh this by the ordinary method of fermentation, recourfe mult be lad to funigation with fulphur, which is callied fluming the cafks. For this fumigation, it is neceffary to have matches made of thick linen-cloth about ten inches long, and an inch broad, thickly coated with brimftone for about eight inches of their length. The cafk is then properly feafoned, and every vent except the bung hole tightly fopped; a match kindled; lowered cown into the cafk, and held by the end undipped until it be well lighted and the bung be driven in ; thus fufpending the lighted match within the calk. Having burnt as long as the contained air will fupply the fre, the match dies, the bung is raifed, the remnant of the match drawn out, and the calk fuffered to remain before the liquor be put into it for two or three hours, more or lefs according to the degree of power the fulphur ought to have. The liguor retains a fmell of the fulphatenus acid; but this goes of in a fhort time, and no bad effect is ever obferved to follow.

In fome places the liquor is left to ferment in open cafks, where it Aands thll the firf fermentation be pretty well over; after which the froft or yeaft colleked upon the furface is taken off, it being fuppofed that it is this yealt mixing with the clear !iguor which caufcs it to fret after racking. The fermentition being totally ceafed, and the lees fubfided, the liguor is racked off into a fref cakk, and the lees filtered as ahove direded. Our author mentions a way of fermenting fruit-liqu rs in broad flatlow vats, not kefs thas five fiet in diameter, and little roore than two feet detp; cach vat containing about two logtheads. In thefe the liquor remains mill it has done rifing, or till the fermentation has nearly ceafed, when it is racked of withour frimming, the critical juactue being cansht bufere the yeat fall : the whole finking gradually together as the liquor is drawn off. In this practie ato the liquer is fehom drawn off a fecond time. fuect, and of a mithlle richonfs The firll kind being ufually dellmed ine fervanto, is mate with very lithe ceremony. " If it is bat zeydur (fays Mr Marhall), and has loody enough, to keep, no matter for the rich.
nefs." The method of producing this auftere liquor is to grind them in a crude under ripe ftate, and fubject the liquor to a full fermentation. - For the fweet liquor, make choice of the fweeter fruits: mature them fully; and check the fermentation of the liquor. - To produce liquors of a middle richnefs, the nature of the fruit, as well as the feafon in which it is matured, mult be confidered. The fruits to be made choice of are fuch as yield juices capable of affording a fufficiency both of richnefs and Il rength; though much depends upon proper management. Open vats, in our author's opinion, are preferable to clofe veffels : but if calks be ufed at all, they ought to be very large, and not filled; nor ought they to lie upon their fides, but to be fet on their ends with their heads out, and to be filled only to fuch an height as will produce the requitite degree of fermentation: but in whatever way the liquor be put to ferment, Mr Marfhall is of opinion that the operation ought to be allowed to go on fieely for the firf time; though after being racked off, any fecond fermentation ought to be prevented as much as poffible.
V. Correaing, provincially called doaroring. The of currea. imperfections which art attempts to fupply in the fe $\mathrm{li}_{\mathrm{i}}$ - ing or doe: quors are, 1. Want of llrength; 2. Want of richnefs. twring the 3. Want of flavour. 4. Want of colour and bright. ${ }^{\text {lifu }}$ rso nefs.

The want of Atrength is fupplied by brandy or any other fpirit in fufficient quantity to prevent the acetous fermentation. The want of richnefs is fupplied by what are generally termed fiveets, but prepared in a manner which our author fays has never fallen under his notice. To fupply the want of flavour, an infufion of heps is fometimes added, which is faid to communicate an agreable bitter, and at the fame time a fragrance; whence it becomes a fublitute for the juices of the rind and kernels thrown away to the pigs and poultry, or other otherwile wafted. The want of coluur is fometimes fupplied by elder berries, but more generally by burnt fugar, which gives the defired colour, and a degree of bitter which is very much liked. The fugar is prepared cither by burning it on a falamander, and fuffering it to drop, as it melts, into water; or by boiling it over the fire (in which cafe brown fugar is to be ufed), until it acquire an agreeable bitter ; then pouring in boiling water in the proportion of a gallion to two lb. of fugar, and fir until the liquor become uniform. A pint of this preparation will colour a liogthe ad of cyder. Brightnefs is obtained by a mixture of the blood of bullocks or fleep; that of fwine being rejected, though it does not appear to be more untit for the purpofe than either of the other two. The only thing neceffary to be done here is to flir the blood well as it is drawn from the animal, ta prevent the parts from feparating; and it ought to be iliered " both ways, for a quarter of an hour." The liquor. however, is not always in a proper condition for being reliued with this ingredient; on which account a little of it ought frequently to be tricd in a vial. A quart or lefs will be fufficient for a hoghlead. After the blood is poured in, the liquor flould be violently agitated, to mis the whole intimately together. This is clone by a flick hit into four, and inferted into the bung-kole; working it brikly about in the liquor un. til the whole be thoroughly mixed. In about 24 hours nefs and fovoer. "The rougher it is, the further it will gos, and the more acceptathe cutom has rendered it rois only the worksen but to their mallers. A palate acemilemed to fweet cyder would jud, 5 c the rough cyder of the farm-houres to be a mixture of cinegar and evater, with a litte diffolved alum to give it rough-
ruit Li the blood will be iubfided, and the liqnor ought in flantly to be racked off; as by remaining upon the blood even for two or three days, it will receive a taint not eafily to be got rid of. It is remarkable that this refinemeat with the blond carics down not only the freces, but the colour alfo; rendering the liquor, though ever fo highly coloured before, ahnoft as limpid as water. Ifinglafs and eggs are fometimes made ufe of in tining cyder as well as wine.

The liquor, called cyderkin, purri, or perkin, is made of the murk or grofs matter remaining after the cyder is prefled out. To make this liquor, the murk is put into a large vat, with a proper quantity of boiled water, which has flood till it be cold again: if half the quantity of water be ufed that there was of cyder, it will be good; if the quantities be equal, the cyderkin will be fmall. The whole is left to infufe 48 hours, and then well prefled: what is fqueezed out by the prefs is immediately tunned up and flopped; it is fit to drink in a few days. It clarifies of itfelf, and ferves in families inttead of fmall beer. It will keep, if boiled, after preffure, with a convenient quantity of hops.

We mult not conclude thts fection without particolar notice of the liquor called cyder zuine, which is
made from the juice of apples takea from the prefs and hoikes, and which being kept three or four years is faid to refemble Rhemith. The method of preparing this wine, as communicated by Dr Ruff of of ${ }^{2,39}$ Ancrica, where it is much practifu, connilts in wine. acevaporating in a brewing copper the freh apple juice co-1wg to till half of it be contumed. The remainder is then Dr Rull's immediately conveyel into a woodera cooler, and afo rops. terwards is put into a proper calk, witl: an addition of yealt, and fermented in the ordinary way. The procefs is evidently burrowed from what has long been pratifed out the recent jutice of the grape, under the term of einc crit, or boiled wine, not only in Italy, but alio in the illands of the Archipelagn, from time immemorial.

This procefs has lately become an ohject of imitation in the cyder counties, and particularly in the weft of England, where it is reported that many hundred hogs. heads of this wine have already been inade ; and as it is faid to betray no fign of an impregnation of copper by the ufual chemical tefts, it is conlidered as perfectty wholefome, and is accordingly drunk without apprehenlion by the common people. Others, however, infpect its innocence; whence it appeared an object of no fmall moment to determine in fo doubeful a matter, whether or nut the liqnor acquires any noxious quality from the copper in which it is boild - With this view Dr Fothergill $\dagger$ made a variety of experiments; + Eatb Fa. and the refute feemed to afloid a flrong prefumption pers, vol. r . that the cyder wine does contaia a minute impregna- p 359 . tion of copper ; not very confiderable indeed, but yet fufficient, in the Doctor's opinion, to put the public on their guard concorning a liquor that comes in fo very " quellionable a thupe."

It is a curious chemical fact, he obferves, if it be really true, that acid liquors, while kept boiling in copper wefels, acquire little or no impregnation from the metal, but prefently begin to act upo:s it whea left to tland in the cold. Can this be owing to the agitation occafioned by boiling, or the expultion of the acrial acid? Amolpheric air powelfully corrodea copper, probably through the intervention of the aerial or tather nitrous acid, for both are now acknowledged to be prefent in the atmofphere. But the latter is doubtefs a much illonger menttruum of copper than the former.

In the prefent procefs the liquor is properly directed to be palled into a wooden cooler as foon as the boiling is completed. But as all acidz, and even common water, acquire an impregnation and unpleafant talle, from itandiug in copper veliels in the cold, why may not the acid juice of apples act in fome degree on the copper before the boiling commences? Add to this, that brewing eoppers, without far more care and attention than is generally hellowed on them in kecping them clean, are extremely apt to contrdet verdegris, (a rank poifon), as appears from the blue or green ftreaks very vilible when thefe veffels are minutely examined. Should the unfermented juice be thought incapable of atting on the copper either in a cold or boiling flate, yet no one will renture to deny its power of wafhing off or diffolving verderris alseady formed on the internal furface of the veffcl. Suppofe only one-eighth part of a grain of verdegris to be contained in a bottle of this winc, a quantity that may elude the ordinary tefts, and that a botule

Thould he drunk daily by a perfon without producing any vioknt fymptom or internal unealinefs; yet what perfon in his fenfes would knowingly chule to hazard the experiment of determining liow long he conld continae even this quantity of a how poifan in his dafy beverave with impunity? Ind yot it is to be fared the experiment is but too often unthinkingly made, not only with ceder-wine, but alfo with many of the foreign wines perpared by a hmila proeefs. lir the grape juice, when evaporated in a copper veffel, under the deromination of aino cotho or boiled wine, cannot but acpaire an equal if not yot fronger impresplation of the metal, than the juice of apples, fecing that verdergis it felf is mannfadured merely by the application of the acid huiks of grapes to plates ut coppit.

Independent of the danger of any metallic impregnation, the Doctor thinks it may be jully quettioned how far the procefs of preparing boiled wines is neceffary or acconcitable to reaton or economy. The evaporation of the muft by long boiling not only occahons an unsectflary watte of both liquor and fuel, but alfo diffpates certain eflential principles, without which the diquor can never undergo a complete fermentation, and without a complete fermentation there can be no perfect wine. Hence the builed wines are senerally crude, heavy, and that, liable to produce indigetion, flatulency, and diarrlicea. If the evaporation be performed hatily, the liquor contraets a burnt empreumatic tale, as in the prefent infance; if nowly, the greater is the danger of a metallic impregnaiinn. For the procefs may be peflumed to be genesally performed in a veffel of brafs or copper, as few families poffefs any other that is fufficiently capacious. Nor can a veflel of catt-iron, though perfectly fafe, be properly recommended for this purpole, as it would probably communicate a chalybeate tate and dark colour to the liquor. At all events, brafs and copper veffels ought to be entirely banifhed from this and eveny other culinay procels.

## Sect, XI. On Manures, and the bef Metheds of collefing them.

We have deferred treating on thefe to the laft part, as they are in fact derived in more or lefs quantity from every operation in hufbandry, though they are undoubtedly the foundation of the whole; for no method yet propofed for maxing a foil fertile without manture has ever been properly afcertained to be fuccefsful. The mode in which thep operate has teen fo fully explained under the artic!e Agriculture, that nothing farther
feems neceffary to be added in this place. Of late, however, a new manure has been introduced into fome countiles, the operation of volhich cannot fo well he ex- plained upon the principles there laid down. This is Gypfum. In the cisthth volume of the Annals of Agriculture we are informed, that it is commonly ured as a manare in Switserdand. In the 10 th volume of the fame work, Sir Richard Sutton gives fome account of an experiment made with it on his eftate; but in fuch an inaccurate manuer, that notbing could be detemined. "'lhe appearance in general ( (ays he), I think, was rather againll the benefit of the plafter, though not decidedly 10. ." Ie tells us, that its virtues were a fub.
ject of Jebate in Germany. In America this fibitame leetns to have met with more fuected than in any ucher country. In the dith volune of Bath Papers, Nir Kirkpatrick of the Ehe of Wight, who had hamelf vilited North America, informa us, that it is macis uled in the United Statco on acentme of its cheapoefond ellisey; thourth, from what is told in the fane place, we mat undon'stedly be led to fupore, that i:s eforacy moult be very great before it can be intived to cheapmofs. In the firit place, it is bromght fram the hills in the neighhourtood of Paris to liwre de Grace, and from theoce expoted to Amara; which of itfele suat oce cathon a contickable expence. though the platee aere arginally given serais. In the bext place, it mant be p)wered in a ftaming mill, and the ther it is powdered lo mach the better. In the third place, it mott be fown over the ground to be manured with it. The quantity for grals is fix buthels to an acre. It ought to be fown ondry fround in a wet day; and its efficacy is faid to lat from feven to thelie years. It operates cotirely as a top dreting.

In the soth volune of Annals of Agriculture, we have fome extracts from a treatile by Mr Powel, prefdenc of the Philadelphia Socicty for encouraging Agricolture, upon the fubject of gypfum as a manure; of the elficacy of which he gives the following initances. 1. In ()Etoher 1786 , plafter of Paris was fown in a rainy day upon wheat-itubble without any previous culture. The crop of wheat hald feares been worth reaping, and no kind of grafs feed had been fiown upon the ground; neverthelef, in the month of June it was covered with a thick mat of white chover, clean and even, from fix to eight inches in height. A piece of ground. adjoining to this white clover was alfo fown with gypfrom, and $e x$ mbited a line appearance of white and red clover mixed with fpenr-grdfs. Some wet ground fown at the fame time was not in the kall improved. - This anecdute relts entirely on the veracity of an anonymous farmer. 2. Eight hulkels of plater of Paris fpreas upon two acres and an half of wheat-inbble ground. which the fpring befure had been fowed with about two pounds of ted clover-feed to the acre for pature, yield. ed five tons of hay by the middle of lune. A linall piece of ground of limilar quality, but without any plaller, produced only one ton and an half in the fame proportion.-Mr Powel concludes in favour of the ef. feets of the platker upon arable as weil as grafs land. Other accounts to the fame purpole have been pub. lihhed; but it does not appear to have been tried in this country.

With regard to the other kinds of manure commonly in ufe in this country, their efficacy is well known; the c only difficulty is to procure them in fufficient quantity. - In fuch lands as lie near the fica, lea-weeds offer an unlimited quastity of excellent manure. In the neighwhich afford thefe are comparatively few ; fo that in moft cafes the farmer mut depend much on his own ingenuity anfwer his purpofes: and the methods taten for this purpofe vary according to the fituation of different pla. ces, or according to the fancy of the hufundman.

In all countries where clalk, marle, or lime are to be had, they are certainly to be canployed in their proper departments ; but hefides thefe, duriz, properly fo calld, mixed with earth or putid animal and vegetable fub. Alances, conflitutes a principal part of the manure. In Nortolk, Mr Marhatl trils ns, that the quality of dung is attended to with greater precifion than in mut other difricts. Tosth-nuck, as it is called, is held in mot eftimation; and the large towns Norwich and Yarmouth fupply the neightowring conntry. As larmouth, bowever, is a marisime place, and otherwile in a manace furnounced by marihes, tlyav is of courfe a fcarce and dear articke; whence, mithad of litecring their horfes with it, they ufe fand. As the bed becomis foited or wer, frelh fand is put on, umil the whoke is in a manner faturated with urine and chong, when it is cleared away, andf reckoned musk of fuch excelient quality, that it is ent for from a sery great diname. With regard to other kinds of dung, that fo com horles fed upon hay and corn is lowked apon to be the bet ; tha: of fatting catile the next ; while the dung of kan catte, particularly of cows, is fuppofed to be greatly inferior, even though turnips maki part of their food. The dung of cattle kept on thraw alone is looked upon to be of little or no value; while zile muck fiom trodden ftraw is hy fome thought to be better than that from the traw which is caten by the lean-lock. - Compofts of dung with earch or marle are very generally ufed.

In the midland counties of England, Mr Marfhall informs, the cores of horns crufhed in a mill have been ufed as manure: though he knows not with what fuccefs. His only ubjection is the difficulty of reducing them to powder. Ding is extremely dear in Nor. folk; halfa guinea heing commonly given for a wag-gon-load driven by five lourfes. Grear quantities of lime and marle are found in this ditrict. - With regard to the method of railing dung in gencral, perhaps the obfervations of Mr Marlhall upon the management of the Yorkinire farmers may be equally fatisfactory with any thing that bas yet been publifhed on the fubject.
"The general practice (fays he) is to pile the dung on the higheft part of the yard; or, which is atill lefs judicions, to let it lie fcatered about on the fide of a llope, as it were for the purpofe of diffipating its virtues. The trine which does not mix with the dung is almolt invariably led off the nearelt way to the common fewer, as if it were thought a nuilance to the premifes. That which mixes with the dung is of courle carried to the midden, and affitts in the general difitipa. tion. A yard of dung, nine-tenths of which are illaw, will difcbarge, even in dry weather, fome of iss more
$A N D R \quad Y$.
Fuid part "c'es; and in rainy weather, is, notwithtanding the Itraw, liable to be wathed away if expoted on a rifinge grouns. But linw much mone liable to wate is a misture of dung and urine, with barely a fufficency us Itraw to keep them tugether: Ia dry weather the thathal ouring is comber:rable; and in a wat teaton every ilhower of rain walhes it away in quantites. - I'he Nerfulk method of butsoming the daar-yard wit! mould is here indifenfably necelfary to comanon gor 1 managentent. There io mo better manate for grais-lands than monld faturated with the onzings of a dunghitl: it gets doan mecker among the grals, and has generally a mure nuble effect than the dungr itfelf. Under thito managenemt the arable land would have the felffance dang io mow has i, white the grafs land would have an enumal huppiy of riches, which now run wale in the Livers and rivuits. - But befure a dung yard can with pruputy be bottomed with mould, the bottom of the Sard meit ought to be properly formed. A part of it fieluated convenien:ly fur carriages to come at, and low caund to recence the entire drainings of the liable, catite thails, and hog tiies, fhould be hullowed out it: the manner of an artificial drinking-pool, with a rim fomewhat rifing, and with covered draits laid into it from the various fources of liquid manure. Daring the fummer months, at leifure times, and embracing opportunit os of back-carriage, fill the hoillow nearly full with mould; fuch as the tcowerings of ditches, the flowel. lings of roads, the maiden earth of lanes and wate corners, the coping of tone-quarries, \&c. \&c. leaving the furface fomewhat difhed; and within this diifh fet the dung pile, caretully keeping up a rim of mould round the bate of the pile higher than the adjuining furface of the yard; squally to prevent extrancous ratter from finding its way into the refervoirs, and to prevent the chape of that which falls within its circuit."

In the firlt volume of the Annals of Agriculume ${ }^{245}$ Mr Young, from a theory that of plants, made feveral experiazento upon charcoal as a ments no manure ; but the reiults uere not iuficiently favourable to indnce a trial of it in the large way. It mant be remembered, that though phlogiton is very probably the true vegetable food, yet it is phlogiton solusilized, as in putrid animat and regetuble lubllances, not in its fixal Itate as in charcual, wheh can have any effect. Sice Agricultere, Part 1. Sect. i. ot ikq.

A very advantageous methou of manuring grafs. lands, wian there is an opporienity, is that of overflowing them with water, which is motly prathifed with low flat grounds. For an accoune of the bent methods in ufe for this purpofe, fee the artiche Mtanow.

HLSSARAS, are the national cavalry of Hungary and Croatia. Their regimentals confilt in a rough furred cap, acorned with a cock's leather (the officers (ither an eagle's or a heron's) ; a doublet, with a pair of breeches to which the Itockings are faltened, and yellow or red bouts: betides, they occalionally wear a hort upper waiftcoat edged with furs, and live rows of round metal buttons; and in bad weather, a cloak. Their arms are a fabre, carbine, and piftols. They are irregular troops: hence, before beginning an attack, they lay themfelves fo flat on the necks of their horfes, that it is hardly ponfible to difcern their force; but being come within piltol-fhot of the enemy, they raife themfelves with fuch furprifing quicknefs, and begin the fight with fuch vivacity on every fide, that, unlels the enemy is accutomed to their method of engaging it is very difficult for troops to preferve their order. When a retreat is neceffary, their horfes have fo much fire, and are fo indefatigable, their equipage fo light, and themfetres fuch excellent horfemen, that no other cavaly can pretend to follow them. They leap over ditches, and fwim over rivers, with firpriling facility. They never encamp, and confe"Iucntly are not burdened with any camp-equipage, laving a kettle and a hatchet to every fix men. They always lie in the woods, out houles, or villages, in the front of the army. The emperor, queen of Hungary, and king of Pulfia, have the greateft number of troops onder this name in their fervice.

HUSSITES, in ecclefiaftical hilory, a party of reformers, the followers of John Hufs.

John Hufs, from whom the Huflites take their name, was born in a little village in Bohemia, called Huls, and lived at Prague in the higheft reputation, both on account of the fanctity of his manners and the purity of his doctrine. He was dillinguified by his uncommon erudition and eloquence, and performed at the fame time the functions of profeffor of divinity in the univerfity, and of ordinary paftor in the church of that city. He adopted the fentiments of Wickliff, and the Wallenfes; and in the year 1407 began openly to oppole and preach againtt divers errors in doétrine, as well as corruptions in point of difcipline, then reigning in the church. Hufs likewife endeavoured to the utmoft of his power to withdraw the univerfity of Prague from the jurifdiction of Gregory XII. whom the kingdom of Bohemia had hitherto acknowledged as the true and lawful head of the church. This occaftoned a violent quarrel between the incenfed arehbithop of Prague and the zealous reformer, which the latter inflamed and augmented from day to day, by his pathetic exclamations again!t the court of Rome, and
the cormptions that prevailed among the facerdotal order.

There were other circumflances that contributed to inflame the refentment of the clergy againf him. He adopted the philofophical opinions of the realifts, and vehemently oppofed and even perfecuted the nominalifts, whofe number and influence were confiderable in the univerfity of Prague. He alfo multiplied the number of his enemies in the year 1408 , by procuring, through his great credit, a fentence in favour of the Bohemians, who difputed with the Germans concerning the number of fuffrages which their refpective nations were intitled to in all matters that were earried by clection in this univerfity. In confequence of a de. cree obtained in favour of the former, which rettored them to their conftitutional right of three fuffrages, ufurped by the latter, the Germans withorew from Prague, and, in the year $1 \frac{409 \text {, founded a new aca- }}{10}$. demy at Leipfick. This event no fooner happened, than Huls began to ioveigh with greater freedom than he had before done againft the vices and corruptions of the elergy, and to recommend, in a public manner, the writings and opinions of Wickliffe, as far as they related to the papal hierarchy, the defpotifm of the court of Rome, and the corruption of the clergy. Hence an accufation was brought againfl him, in the year 1410 , before the tribunal of John XXIII. by whom he was folemnly expelled from the communion of the church. Notwithlanding this fentence of excommunication, he proceeded to expofe the Romith church with a fortitude and zeal that were almoll univerfally applanded.

This eminent man, whofe piety was equally fincere and fervent, thomb his zeal was perhaps too violent, and his prodence not always circumfpect, was fummoned to appear before the council of Conflance. Secured, as he apprehended, from the rage of his enemies by the fafe conduct granted him by the emperor Sigifmund, for his journey to Conftance, his refidence in that place, and his return to his own country, John Hufs obeyed the order of the council, and appeared before it to demonflate his innocence, and to prove that the charge of his having deferted the church of Rome was entirely groundlefs. However, his enemies fo far prevailed, that by the molt fcandalous breach of public faich, he was calt into prifon, declared a heretic beeaufe he refufed to plead guilty againft the dictates of his confcience, in obedience to the council, and burnt alive in 1415 ; a punifhment which he endured with unparalleled magnanimity and refignation.

The fame unlappy fate was borne by Jerome of Prague, his intimate companion, who attended the council, in order to fupport his perfecuted friend. Jerome, indeed, was teriified into temporary fubmiffion; but he afterwards refumed his fortitude, and maintained the opinions, which he had for a while deferted through fear, in the flames in which he expired in $1+16$.

The difciples of Huls adhered to their malter's doc. trine after his death with a zeal which broke out in. to an open war, that was carried on with the mofl favage and unparalleled barbarity. John Zika, a Bohemian knight, in 1420 , put himfelf at the head of the Hulites, who were now become a very confiderable

## H U T

afings party, and threw off the defpotic yoke of Sigifmund who had treated their brethren in the mofl barbarous manner. Zifka was fucceeded by Pr copius, in the year 1424. 'The acts of barbarity that were commit. ted on both fides were thocking and horrible beyond exprtfion: for notwithfanding the irreconcileable uppolition between the seligions fentiments of the contending parties, they both agreed in this one horrible principle, that it was innocent and lawful to perfecute and extirpate with fire and fword the enemies of the true religion: and fuch they reciprocally appeared to each other. Thefe conmene ishs in a great meafure fibb. fided, by the interference of the council of lakil, io the year 1433 .
'The Huflites, who were divided into two parties, viz. the Calixtines and "l'aborites, fpread over all Pohemia and Hungary, and eren Silefia and Poland; and there are fome remains of them ltill frobitting in all thole parts.

HUSTINGS (from the Saxon word Hiffinge, i.e. concilum, or curia), a court held in Guild-hall before the lord-nayor and aldermen of London, and reckoned the fupreme court of the city. Here deeds may be inrolled, outlawries fued out, and replewins and writs of error determined. In this court alfo is the election of aldermen, of the four members of parliament for the city, \&c. This court is very ancient, as appears by the laws of Edward the Confentor. Some other cities bave likewife had a court bearing the fame name, as Winchelter, York, \&ic.

HUSUM, a town of Denmark, in the duchy of Slefwick, and capital of a bailisich of the fame name, with a Itrong citadel, and a very hand fome church. It is feated near the river Ow, on the German Sca; and is fubject to the dukes of Holltein-Gottorp. E. Long. 9.5.N. Lat. 54.55.

HUTCHESON (Dr Francis), a very elegant writer and excellent philofopher, was the fon of a diffenting minitter in the north of Ireland, and was born on the 8th of Augull $16 g+$. He eally bifcovered a fuperior capacity; and having gone through a fchool. education, began his courfe of philofoplyy at an academy, whence he remored to the univerfity of Glatgow, where he applitd himfelf to all the parts of literature, io which his progrefs was fuitable to his uncommon abilitics.

Ie then returned to Ireland; and entering into the miniltry, was jult about to be fettled in a fmall con. gregation of cifenters in the north of lreland, when fome gentlemen abous Dublin, who knew his grcat abilities and virtues, insited him to take up a private academy there. He complied with the invitation, and met with much fuccefs. He bad been fixed but a fhort time in Dublin, when his fingniar merits and accomplifhments made him generally known; and his acquaintance was fought by men of all ranks, who had any tafte for literature, or any regard for learmed men. The late lord wifcount Molefworth is faid to have taken great pleafure in his converfation, and to have aflifled him with his criticifms and ublervations upon his "Inquiry into tbe Ideas of Erauty and Virtue," before it came abroad. He recejved the fame favour from Dr Synge, lord bithop of Elphin, with whom he alfo lived in great friendhip. The firt edition of this performance came abroad without the au-
thor's name, but the merit of it would not faffer him Hutches n, to be long concealed. Such was the reputation of the Hesctanfen work, and the ideas it had raited of the anthor, that lord Granville, who was then lord lieutemant of Ireland, fent his private fecretary to inquire at the bookfeller's for the author; and when he could not learn his name, he left a letter to be convesed to lima: in confequence of which he foon became acquairted with his exeellency, and was treated by him, all the time he continued in his government, with dillinguithed marks of familiarity and efferm.

From this time his acquaintance began to be flitt more courted by men of dalkinction either for facion or literature in locland. Archbithop King, the ane thor of the celcbrated book $D$ e crighie m.ali, held him in great efleem; and the ficencthip of that prelate was of great ufe to him in ferecning him from two feveral attempts made to profecusc him. for dering to take upon him the education of youth, withur having qualitied himelf by fubforibing the ecelefialtical canons, and obtaining a licence from the bifhop. He lad alfo a large flare in the ellecm of the primate Bolter, "ho through his infuence made a conation to the univertity of Glalgow of a yeally fund for an exhibitioner to be bred to any of the learned profeflions. A fou years after his "Inquity into the Idea. of Beauty and Virtue," his " I'reatife on the Pafinuns" was publifhed: both the fe works have been often reprinted; and always admired, buth for the fero ment and language, even by tbofe who have not affened to the philofophy of them, nor allowed it to have any foundation in nature. About this time the wrote fome philofuphical papers, accounting for laushter, in a rif. ferent way from Hobbes, and more bunourable to hus man natuic: wheh papers were publithed in the col. lection called hils raicus's Laticios.

After he had taught in a private academy at $\mathrm{D}_{\text {tib }}$. lin for feven or cight years with great reputation and fuecefs, he was called, in the year $1 / 20$, to Scotlams, to be a profellor of phlofophy in the univefity of Glafgow. Several young gentlemen came along with him from the academy, and his high reputation drew many more thither both from Englans and Ireland. Here he fpent the remainder of his life in a manner highly honourable 10 himfelf and omamental to the univerfity of which be was a member. His whole time was divided tetween his fludies and the daries of. his office; except what he alloited to friendliip and fecicty. A firm conkitution and a pretty uniform Aate of good health, except fome few night attacks of the grout, fermed to promife a longer life: ye: the did nut exceed the 53 d year of his age. He was narried, foon after his fetterment in Dutlin, to Mirs Mary Wilfon, a genteman's caughter in the cotnty of Lang. ford; by whom he left behind him one lon, Francis Hutchefon, docior of medicine. By this gentleman was publithed, from the original manufcript of his father, "A fyftem of Moral l'hilofophy, in three books, by Francis Hutchefon, LL. D. at Glafgow, 1;j5," in two volumes, 4 to.

HUTCHINSON (Johrs), a philo\{ophical writer. whofe notions have made no inconfiderable noife in: the world, was barn in 1674. He ferved the duke of: Somerfet in the capacity of tteward; and in the courfc. of his travels from place to place employed himfelf in.

## II U Y [ 702 ] F U Y

Huxig collecting fiffis: we are told, that the large and noble collection bequeathed by Dr Woodward to the univernty of Cambridge was actually made by him, and
even unfairly oltained from him. When he lift the duke's iervice to indulge his iludies with more frecdom, the duke, then nather of the horfe to George 1. made him his riding furveyor, a kind of finecure place of 2001 a year with a good houfe in the Mcufe. In 1724 he puoblined the fird part of Mofes's Primeipia, in which he ridiculed Dr Woodeard's Natural Hittory of the Earth, and exploded the d atrine of gravitation eftatbined is Newton's Frimifia: in 1727, he puhlifeed the fecond part of Alofes's Primitia. containing the principles of the Seriptere Philofophy. From this time to his death, le publined a volume cuery year or two, which, with the MSS. he left behind, were publified in 1788 , in 12 vols 8 so. On the Nonday tefore his dath, Dr Mead urged him to be bld; faying pleafantly, "I will foon fend you to Noles," meaning to his thedies: but Mr Hutchin. fon taking it in the literal fenfe, anfwered in a muttering tone, "I believe. " Doctor, you will;" and was fo difpleafed, that he difniffed him for anotler phyfician; but died in a few days afier, Auguld 28. 1-37. Singular as his motions are, they are not without fonse delenders, who have obtained the appellation of Hfu chanfontans. The reader may find a ditlinet and comprehenfive accomt of the Hutchinfonian fyltem in a bouk intitled, Though's comarning Religion, See. printed at Edinbtrgh 1ifes: an! in a letter to a bihop, annexed to it. lirt pinted in 1732 .

HUXING of pike, among fihermen, a particular method of catching that firb.

For this purpofe, they take 30 or 40 as large blad. ders as can be got : How them up, and tie them clofe and ttrong; and at the mouth of each tie a line, longer or thorter according to the depth of the water. At the end of the line is fattened an armed hook, artfully baited; and thus they are put into the water with the advantage of the wind that they may gently nove up and down the pond. When a matter pike has ftruck himfelf, it affords great entertainment to fee him bounce about in the water with a badder faftened to him : at latt, when they perceive him almolt fpent, they take himup.

HUY, a town of the Netherlands, in the hifhopric of Liege, and capital of Condrafs. It is advantageouny feated on the river Maefe, over which there is a bridge. E Lonc. 10 2?. N. Lat. 52. 3 I.

HUYGENS (Chritian), one of the greateft mathematicians and altronomers of the 1 th century, was the fon of Conllantine Huygens, lord of Zuylichem, who had ferved three fucceffive princes of Orange in the quality of fectetary; and was horn at the Hasuc, in 1629 . He difcovered from his infancy an extraordinary iondnefs for the mathematics; in a litte time made a great progrefs in them; and perfected himfelf in thofe thadics under the famous profeflor fichonten, at Leguen. In $16+9$, he went to Flolftein and Denmark, in the retinue of Henry count of Naffan; and was extremely detirous of going to Sweden, in order on fee Des Cartes, but the count's fhort flay in Den. mark would not permit lim. He eraretled into France and England; was, in ICC $1_{3}$, made a member of the Royal Socity; and, upon his return into France, M.
$\mathrm{N}^{2}: 60$.

Colhert, being informed of his merit, fettled a confi- Huyfun derable penfion upon him to engage him to fix at Paris; to which Mr Huygens confented, and ftaid there from the year 1666 to 168 I , where he was admitted a nember of the Academy of Scimees. He loved a quiet and Atudious manner of life, and frequently resired into the country to avoid interruption, lut did not coutrast that morofenefs which is fo frequently the eflect of folitude and retirement. He was the firlt who difoovered Saturn's ring, and a third fatellite belonging to that planet, which had hitherto efcaped the eyes of atmoners. He difcowred the means of rendering clocks exact, by applying the pendulam, and rendering all its vibrations equal by the cyeloid. He bron, ht telefcopes to perfection, made many other ufeful difcoveries, and died at the Hague in 1805 . He was the author of feveral excellent waks. The principal of thefe are contained in two collections; the firt of which was printed at Leyden in 1682, in quarto, noder the titie of Opera virria; and the fecund at Am. Herdam in 1728 , in two volumes quarto, intitled Opera religua.

HUYSUM, the name of feveral Dutch painters; the mon celcbrated of whom was John, whofe fubjects were flowers, $f$ uit, and landfapes. According to M, Palkington, this illultrious painter hath furpafled all who have ever painted in that Ityle; and his works excite as much furprife by their finilhing as they excite adniration by their truth. He was born at Amilerdam in 1682 , and was a difciple of Jallus van Huyfum his father. He fet out in bis profeflion with a molt commendable principle, not fo much to paint for the acquitition of money as of fame; and therefore he did not aim at expesition, but at delicacy. and, if poffible, to arrive at perfection in his art. Having attentively itudied the pictures of Mignon, and all other artifts of dittinction who had painted in his own ityle, he tried which manner would fooneft load him to imiate the lightnefs and fingular beauties of each Hower, fruit, or plant, and then fixed on a manner peeuliar to himfelf, which feems almolt inimitable. His pictures are hinifhed with inconceivable truth; for he painted every thing after nature ; and was fo fingulaly exact, as to watch even the hour of the day in which his model appeated in its greatelt perfection. By the judicious he was accounted to paint with greater freedom than Mignon or Brueghel; with more tendernefs and nature than Mario da Fiori, Michael Angelo di Campidoglio, or Segers; with more mellownets than De Heem; and greater force of colouring than Baptitt. His reputation rofe to fuch a height at lat, that he fixed immoderate prices on his works; fo that none but princes, or thofe of princely fortunes, could pretend to become pur haters Six of his paiatings were fold at a public fake in Holland for prices that were almot incredible. One of them, a fower piect, for fourteen hundred and fifty guilders; a fruit piece for a thouland and five guilders: and the frailer pictures for nine hundred. The valt fums which van Huyfum received for his works, caufed him to redouble his endeavours to excel; no perfon was admitted into lis room while he was painting, not even his brothers; and his method of mixing the tints, and preferving the luttre of his colours, was an impenetrable fecret, which he never 2
would

## H Y A

mysfum. would difclofe. Yet this conduet is certainly not to his honour, but rather an argument of a low mind, fearfui of being equalled or furpaffed. From the fame principle, he would never take any difciples, except one lady, named Haverman ; and he grewenvious and jealous even of her merit. By feveral domeftic difquiets his temper became changed; he grew morofe, fretful, and apt to withdraw himfelf from fociety. He had many enviers of his fame, which has ever been the fevere lot of the moft deferving in all profeffions; but he continued to work, and his reputation never diminifhed. It is univerfally agreed that he has excelled all who have painted fruit and flowers before him, by the confeffed fuperiority of his touch, by the delicacy of his pencil, and by an amazing manner of finifhing; nor does it appear probable that any future artilt will become his competitor. The care which he took to purify his oils and prepare his colours, and the various experiments he made to difcover the moft luftrous and durable, are inflances of extraordinary care and induftry as well as capacity. From having oblerved fome of his works that were perfectly finifhed, fone only half finithed, and others only begun, the principles by which he condueted himfelf may perhaps be difcoverable. His clotbs were prepared with the greateft care, and primed with white, with all poffible purity, to prevent his colours from being obfcured, as be laid them on very lightly. He glazed all other colours except the clear and tranfarent, not omitting even the white ones, till he found the exact tone of the colour ; and over that he finifhed the forms, the lights, the fhadows, and the reflections, which are all executed with precifion and warmth, without drynefs or negligence. The greatelt trutil, united with the greateft brilliancy, and a velvet fofterefs on the furface of his objects, are vifible in every part of his compofitions; and as to his touch, it looks like the pencil of nature. Whenever he reprefented flowers placed in vales, he always painted thufe vales after fome clegant model, and the bas-relief is as exquifitely finithed as any of the other parts. Through the whole he hows a delicate compofition, a fine harmony, and a molt thappy effect of light and fhadow. Thofe pictures which he painted on a clear ground are preferred to others of his hand, as having greater luftre, and as they demanded more care and exactnefs in the fimithing; yet there are fome on a darkith ground, in which appears rather more force and harmony. It is obferved of him, that in the grouping of his flowers, he generally defigned thofe which were brightelt in the centre, and gradually decreafed the force of his colour from the centre to the extremities. The birds nefts and their eggs, the feathers, infects, and drops of dew, are expreffed with the utmoft truth, fo as even to deceive the fpectator. And yet, after all this merited and juft praife, it cannot but be confeffed, that fometimes his fruits appear like wax or ivory, without that peculiar foftefefs and warmth, which is conitantly obfervable in nature. Befide hismerit as a flower painter, he allo painted landfcapes with great applaufe. They are well compofed; and although he had never feen Rome, he adorned his fcenes with the noble remains of ancient magnificence which are in that city. His pictures in that fyle are well coloured, and every tree is diftinguifted by a touch that is proper for the leafing. The grounds Vol. VIII. Part II.
are well broken, and difpofed with calte and juigment; Huzzeo: the figures are defigned in the manner of Laireffe, $\underbrace{\text { Hoscres: }}$ lighly finithed, and touched with a great deal of fpirit ; and through the whole compolition, the ferene reprefents Italy, in the trees, the clouds, and the fies. He died in 1749, aged 67 .

HUZZOOR, a Hindoftan word fignifying The preSence; applied, by way of eminence, to the Mogul's court. According to polite ufage, it is now applied to the prefence of every Nabob or great man.

Herzoor Nieves; the fecretary who refides at court, and kceps copies of all firmanns, records, or letters.

HYACINTH, in natural hiftory, a genus of pel. lucid geme, whofe colour is red with an admixture of yellow.

The hyacinth, though lefo firiking to the ege that any other red gem, is not without its beauty in the finett fpecimens. It is found of various fizes, from that of a pin's head to the third of an inch in diamter. They are harder than quartz-cryflals: tranfparent, and formed into prifms pointed at both ends. Thefe point: are always regular with regard to the number of facets; being four on each facet, but the latter feldom: the fides of the main body are alfo very uncertain, in regard both to their number and flape; being found of four, five, fix, feven, and fometimes of eight lides; fometimes being fo comprefled as almott to refemble the face of a fpherical facetted garnet. Sometimes they are of a dodecaedral foun like the garnet, but with more obtufe angles. The fpecific gravity of the hyacinth, according to Dutans, is 2.631 : but Rone de L'ifle fays that Lrifon found it to be 3.6873 ; and the European hyacinths to be 3.760.
The hyacinth, as well as all other gems, is divided into oriental and occidental; the former being very hard and brilliant, fo that they are frequently ranked among the topazes; but when foft, they are fuppofed to belong to the garnet kind, as mentioned ander chat article. The hyacinths, however, may generally be dilinguifhed from the garnets by lufing their colour in the fire, becoming white, and not melting. There is a kind of a yellow brown hyacinth, rcfembling the colour of honey, which is diftinguifhel from the reit by the remarkable property of not beich eleetrical, and being likewife inferior in hardnefs.

Our jewellers allow all thofe gems to be hyacinths or jacinths that are of a due hardnefs with the mixed colour above mentioned; and as they are of very dif. ferent beanty and value in their fereral degrees and mixture of colours, they divide them into four kinds; three of which they call byacinths, but the fourth, wery improperly, a ruby. 1. When the flone is in its moft perfect flate, and of a pure and bright flame colour. neither the red nor the yellow prevailing, in this fate they call it byacintha la belle. 2 . When it has an overpropoction of the red, and that of a dufliker colour than the fine high red in the former, and the yellow that appears in a faint degree in it is not a fine, bright, and clear, but a dufky brownifh yellow, then they call it the foffran bywinth. 3. Such flones as are of a dead whitifh yellow, with a very fmall proportion of red in then, they call amber-byainths. And, 4. When the flone is of a finc deep red, blcaued with a dunky and very deep yellow, they call it a rubacelle.

## H Y A [ 794 ] H Y B

Hyacimbus Ent though the over proportion of a Arong red in Hyacinthia this gem has made people refer it to the clafs of rubies, its erident mixture of yellow thows that it truly belones to the hyacinth.

The hracinth la belle is found both in the Faft and Wet ladics. 'The oriental is the harder, but the American is often equal is it in colour. Tlise rubachle is found only in the Eatt Indies, and is generally broundt over among the rubies; but it of Little value: the other varicties are found in Sileta and Bohemia.

HYACIN"MUSS, hyacinth, in betany: A genus of the monogynia order, belonging to the hexandria clafs of plants: and in the natural method ranking under the icth order, Coronuria. The corolla is campanulated, and there are three melliferous pores at the tup of the germen. There are fix fpecies; of which the moft romarkable is the orientalis, or eaftern hyacinth. Of this there are a great number of varicties, amounting to fome hundreds, cach of which differs from the telt in fome refpeet or other. This plant hath a large, purplith, bulbous root, fending up feveral narrow eicet leaves eight or ton inches long; the flower thaik is uprighe, robuft, and fucculent, from Io to 15 inches in hight; adorned upward with mariy lares funnel or bell haped flowers, fwelling at the bafe, and cut half way into fix parts; collected into a large pyranida! Spike of different colours in the varieties; Alowering in April or Mar.

Thefe phants are cultivated with the greatef fuccels in Hollonid, from whence great numbers are annually imported into Britain. Each variety is by the florifts diftinguithed cither by the name of the place where cirl raifed, or the perfon who raifed them, or the rames of illultrious perfonages, as of kings, generals, pocts, and celebtated ancient liftorians, gods, goddeffes, sec. They are fuld by all the fecd-dealers. The prices are from three pence per root to five or ten pounds or more; and tome varities are in fuch high elleem among the foritts, that $20 \%$ or $30 \%$ will be given for a fingle bulb. They are hardy, and will profper any where, though the fine kinds require a little melter during the winter. They may be propagated cither by feeds or off.efts from the roots.

The propertics of a good oriental hyacinth are, a Alem pertectly upright, of modcrate length, and fo Atrong and well-proportioned that it will fultain the weight of the florets without bending: the florets hould be large, fwelling below, expanded above, and numerous, 10 or 15 at leaft. but are often 20 or 30 in number; and fould be placed equally round the item, the pedicles on which they grow longer below than above, diminitning gradually in length upward in fach a manner as to reprefent a pyramid, and each pedicle fufficiently frong to fupport the florets with. out drooping. The curious in thefe plants are careful never to plant the tine forts two years together in the fame bed of earth; fur, by planting them every year in a freth bed, the beauty of the fowers is greatly improved.
HYACINTHIA, in antiquity, feafts held at Sparta, in honour of Apollo, and in commemoration of his favourite Hyacinth.

This Hyacintly was the fon of Amyclas king of Sparta, and was beloved both by Apollo and Zephy.
rus. The youth thowing molt inclination to the former, his rival grew jealous; and, to be revenged, one day as Apollo was playing at the difcus, i. e. quoits, with Hyacinth, Zephyrus turned the direction of a quoit which Apollo had pitched full upon the head of the unlappy Hyacinth, who fell down deal. Apollo then transformed him into a flower of the fame name; and as a farther token of refpeet, they fay, commanded this featt. Tlue Hyacinthia lated three days; the firt and third whereof were emphoyed in bewaiting the death of Hyacinth, and the fecond in featting and rejoicing.

HYADES, in afronoms, are leven flars in the bull's head, famous among the poets for the bringing of rain. Whence their name Tafns, from the Greek vir "to rain." The principal of them is in the left eye, by the Arabs called aldebaran.

The poets feign them the daughters of Atlas and Pleone. Their brother Hyas being torn to pieces by a lioners, they wept his death with fuch veinemence, that the gods, in compafion to them, ranllated them into heaven, and placed them in the bull's forehead, where they continue to weep; this conftellation being fuppofed to prefage rain. Others reprefent the Hyades as Bacchus's nurfes; and the fame with the Dodonides, who fearing the refentment of Juno, and flying from the cruelty of king Lycurgus, were tranlated by Jupiter into heaven.

HYAENA, in zoology, fee Canis.
HYAENIUS lafis, in natural hitory, the name of a fone faid to be found in the eyes of the hyana. Pliny tells us, that thofe creatures were in old times hunted and dellroyed for the fake of the fe Atones, and that it was fuppofed the gave a man the gift of prophecy by being put under his tongue.

HYBERNACULUM, in botany, winter-quafTERS; defincd by Linnæus to be part of the plant which defends the embryo herb from injuries during the feverities of the winter. See Bulb and Gemma.

HYBLA (anc.geog. ), or Megara; whichlait name it took from the Megareans, who led thither a colony ; called alfo Fivh Parva, and Galeotis. In Stra. be's time Megara was extinc, but the name Hyblu re. mained on account of its excellent honey named from it. It was lituated on the eaft coalt of Sicily, between Syracufe and the Leontines. Galesta, and Mergarenfes, the names of the prople, who were of a prophetic fpirit, being the defcendants of Galeus the fon of Apollo. Hydlass the epithet. - The hyblai colles, fmall eminences at the fprings of the Alabus near this place, were famous for their variety of flowers, efpecially th.yme ; the honey gathered from which was by the ancients reckoned the beft in the world, excepting that of Hymettus in Attica. By the moderns it was called Mel Paf\%, for the fame reafon, namely, on accotunt of its excellent honey, and extraordinary fertility, till it was overwhelmed by the lava of Aitna; and havirg then become totally barren, its name was changed to Mal Paffi. In a fecond eruption, b; a fhower of athes from the mountain, it foon reaffumed its ancient beauty and fertility, and for many years was called BCl $P a \sqrt{5}$ : and laft of all, in the year 1669 , it was again laid under an occan of fire, and reduced to the molt wretched fterility ; fince which time it is again known

Iffla by the appellation of Mal Paft. However, the lava in its courfe over this beautiful country has left Feveral little iflands or hillocks, jult iuficient to thow whas it formerly was. Thefe make a fingular appearance in all the bloom of the moll luxuriant vegetation, furrounded and rendered almolt inacceffible by large fietds of black and rugged lava.

Hrbl.s-Mnjor, (anc. greng.), was fituated in the tratt lying between mount iEtna and the river Symethus. In Paufanias's time defolate.

Hrela-Miarbp, or Her\&a, (anc. geng.), an inland town of Sicily, fituated between the rivers Oanus and Herminius; now Ragusa.

HYBRIDA planta, a monftrous production of two different fpecies of plants, analogous to a mule among animals. The feeds of hybrid plants will not propagate.

HYBRISTICA, (of vop, ingitry), in antiquity, a solemn fealt held among the Greeks, with facrifices and other ceremonies; at which the men attended in the apparel of women, and the women in that of men, to do honour to Venus in quality either of a god or a goddefs, or both. Or, according to the account given by others, the bybriltica was a feall celt brated at Argos, wherein the women, being drefled like men, infulted their hufbands, and treated them with all marks of fuperiority, in memory of the Argian dames having anciently defcoded their country with fingular courage againat Clcomenes and Demaratus.
Plutarch fpeaks of this fealt in his treatife of the great actions of women. The name, he obferves, fignifits infamy; which is well accommojated to the ocrafion, wherein the women Rrutted about in men's cloaths, while the men were obliged to dangle in petsicoats.
HYDATIDES, in medicine, little tranfparent veficles or bladders full of water, fometimes found folitary, and fometimes in cluters, upon the liver and various other parts, efpecially in hydropical cafes.

HYDATOSCOPIA, called alfo hydromancy, a xind of divination or method of foretclling future events by water.

HYDE (Edward), carl of Clarendon, and lord high chancellon of England, was defcended from an ancient family in Chefhire, and born at I)inton near Hindon, in Willthire, in 600 . He was entered of Magdaten. hail, Oxford, where, in 1625, he took the degree of A. B. and afterwards futedied the law in the sliddleTemple. In the parliament which begun at Weat minfter April to. 16,0, he ferved for Wotion-Baffet in Willhire. But that parliament being foon after diffolved, he was chofen for Saltahh in Cornwall in the long parlianmen. His abilities were much taken notice of, and he was eriployed in feveral committees to examine into divers grievances; but at lat being difGatisficd with the proceedings in the parliament, he retired to the king, and was made chancellor of the exchequer, a privy-counfellor, and knight. Upon the declining of the king's caute, he went to France, where, after the death of king Charles I. he was fworn of the privy councilto Cliarles II. In 1649, he and the lord Cottington were fent anibaffadors extraordinary into Spain, andi in 1657 be was confltuted lord Bigh chancellor of England. The year before the reforation, the duke of York fell :n lose with Mrs

Anne Hyde, the lord cbancellor's eldeft daughter, but carefully concealed the amour both from the king and

Hyode. chancellior. As it was by a promite of marriage, however, that he had grained upon her, he was afterwards induced to fultil his engagement, and the ceremony was performed after the relloration. Upon the reitoration, her father was chofen chancellor of the uaiverfity of Oxford; and fonn after created baron Hindon, in Wiltthire, vifcount Cornbury in Osfurdhire, and earl of Clarendon in Wilthire ; and on the death of Henry lord Falkland, was made lord lieusenant of Oxfordthire. He took care neither to load the king's prerogative, nor encroach upon the liberties of the people: and therefure would not fet afide the petition of right, nor endeavour to raife the far-chamber or high commiftion courts again: nor did he attempt to repeal the bill for triennial parliaments; and when the might have obtained two millions for a flanding revenue, he akked but one million two hundred thoufand pounds for an. num, which he thought would ttill put the king upon the neceffity of having recourfe to his parliament. In this juft conduct he is faid to have been influenced by. the following incident, which lappened fome years be fore. When be firll began to grow eminent in the law he went down to vilit his father in Wilt thise; who, one day as they were walking in the fields together, obferved to him, that men of his profeftion were apt to fretch the prerogative too far, and to ingure liberty; but charged him. if ever he canse to any eminence in his profeflion, never to facrifice the laws and liberty of his conntry tu his own intered or the will of his prince: he repeated his advice twice; and inmediately falling into a fit of arrapoplexy, died in a lew hours: and this circumftance bad a lafling in Ruence upon litn. Iri i 662, he oppoled a propofal for the king's marriage with the infanta of Porugal, and the fale of Dunkirk: however, the following year, articles of high ireafon were exhibited againlt him by the earl of Irrifol; but they were rejected by the loule of lords. In 1604 , he opfofed the war with Ilolland. In Augrat :667, lie poas removed from his poll of lorl chancellor; and in Norcinber fullowing impeached of high treafon and other crimes and mifdemeanors by the houfe of comnons: upon which he retired into 「rance, when a bill was pafted for baninhing hin from the king's dominions. Sce Dritain, $n^{\prime} 211,21 \%$. He refided at Rouen in Normandy: and dying there in 16;4. his body was brought to England and interred in Wea-minfter-abbey. He wrote, 1. A hiflory of the rebellion, 3 vols folio, and 6 wols octavo; a lecond part of which was lately bergueathed to the public by his lordthip's defcendant the late lord Myde and Cornbury. 2. A letter to the cuke of Jork, and another to the duchefs of Xork, upon occation of their embracing the Romifh religion. 3. An anfwer to Hobbes's Leviathan. 4. A hitory of the rebelion and civil wars in Ireland, intavo; and fume other works.

The reverend Mr Granger, in his Biographical Hiftory of England, cblerves, that " the virtue of the earl of Clarendon was of too Pubborn a nature for the age of Charles II. Could he have been content (fays he) to have enflaved millions, he might have beea more a movarch than ari unprincely king. But he did not only fook upon himfelt as the guardian of the laws and liburtics of his comentry, but kad allo a pride 5 C:

## H Y D $\quad\left[\begin{array}{r}79\end{array}\right.$

Hyde. in his nature that was above vice; and chofe rather to be a vi¿tim bimfulf, than to facrifice his integrity. He had only one part to act, which was that of an honeft man. His enemies allowed themfelves a much greater latitude; they loaded him with calumnies, blamed him even for their own errors and mifconduct, and helped to ruin him by fuch buffooneries as he defpifed. He was a much greater, perhaps a much happier, man, alone and in exile, than Charles the Second upon his throne."
And the following character of this nobleman is given by Mr Walpole: "Sir Edward Hyde (fays he), who oppofed an arbitrary court, and embraced the party of an afflicted one, mult be allowed to have acted confcientionly. A better proof was his behaviour on the reltoration, when the torrent of an infatuated nation intreated the king and his minitter to be abfolute. Had Clarendon fought nothing but power, his power had never ceafed. A corrupted court and a blinded populace were lefs the caufes of the chancellor's fall, than an ungrateful king, who could not pardon his lordhip's having refufed to accept for him the flavery of his country. Like jultice herfelf, he held the balance between the neceffary power of the fupreme magitrate and the interells of the people. This neverdying obligation his cotemporaries were taught to overlook and clamour againit, till they removed the only man, who, if be could, would have corrected his malter's evil government. Almoll every virtue of a miniter made his character venerable. As an hiftorian, he feems more exceptionable. His majelty and eloquence, his power of painting characters, his knowledge of his futject, rank him in the firt clafs of writers; yet he has both great and little faults. Of the latter, his flories of ghotts and omens are not to be dcfended. His capital fault is his whole work being a iaboured juftification of king Charles. If he relates faults, fome palliating epithet always flides in; and he has the art of breaking his darkeft fhades with gleams of light that take off all impreffion of horror. One may prononnce on my lord Clarendon, in his double capacity of ftatefman and hiftorian, that he acted for liberty, but wrote for prerogative."

Hyde (Dr Thomas), profeffor of Arabic at Oxford, and one of the moit learned writers of the a 7 th century, was born in 1036; and ftulied firft at Cambridge, and afterwards at Oxford. Before he was 18 years of age, he was fent from Cambridge to London to affit Mr Brian Walton in the great work of the Polyglot Bible; and about that period undertook to tranforibe the Perfian Pentateuch out of the Hebrew characters, which archbihop Uher, who well knew the difficulty of the undertaking, pronounced to be an impolfible tafk to a native Perfian. After he had happiby fucceeded in this, he affifted in correcting feveral parts of Mr Walton's work, for which he was perfectly qualified. He was made archdeacon of Gloucefter, canon of Chrit-church, head keeper of the Bodlcian library, and profeflor both of Hebrew and Arabic, in the univerfity of Oxford. He was interpreter and fecretary of the Oriental languages, during the reigns of Charles II. James 11. and William III.; and was perfectly qualified to fill this poit, as he could converfe in the languages which he undertood. There never was an Englifhman is tis fituation of life who made fo
great a progrefs; but his mind was fo engroffed by his beloved fludies, that he is faid to have been but ill qualified to appear to any advantage in common converfation. Of all his learned works (the very catalogue of which, as obferved by Auth. Wood, is a curiofity), his Religio Viterum Perfarum is the moft celcbrated. Dr Gregory Sharpe, the late learned and ingenious mafter of the Temple, has collected feveral of his pieces formerly printed, and republifhed them, with fome additional differtations, and his life prefixed, in two elegant volumes quarto. This great man died on the 18th of Vebruary, 1;02. A. mong his other works are, 1. A Latin traullation of Ulug Beig's obfervations on the longituce and latitude of the fixed itars; and, 2. A catalogue of the printed books in the Bodleian library.

HYDNUM, in botany: A gcnus of the natural order of fungi, belonging to the cryptogamia clafs of plants. The fungus is echinated or prickly on the under fide. One of the fpecies, named the Imbricatun, is a native of Britain, and is found in woods. It hath a convex hat, tiled, flanding on a fmooth pillar, of a pale fefh-colour, with white prickles. It is eaten in Italy, and is faid to be of a very delicate tafte.

HYDRA, in fabulous hiftory, a ferpent in the marfh of Lerna, in Peloponnefus, reprefented by the poets with many heads, one of which being cut off, another immediately fucceeded in its place, unlefs the wound was inftantly cauterized. Hercules attacked this monfter; and having caufed Iolaus to hew down wood for tlaming brands, as he cut off the head! he applied the brands to the wounds, by which means he deftroyed the Hydra.

This hydra with many heads is faid to have been only a multitude of ferpents, which infetted the marthes of Lerna near Mycene, and which feemed to multiply as they were deftroyed. Hercules, with the affillance of his companions, cleared the country of them, by burning the reeds in which they lodged.

HyDRA, in allronomy, a fouthern contellation, confilting of a number of itars, imagined to reprefent a water ferpent. The flars in Hydra, in Ptolemy's catalogue, are twenty feven; in Thcho's, nineteen; io Hevelius's, thirty-one.

Hydra, in zoology; a genus of the order of zocphyta, belonging to the clafs of vermes. There are feveral fpecies, known by the general name of polypes. See Polype; and Animalculf, $n^{\circ} 24$. \&f feq.

HYDRAGOGUES, among phyticians, remedies which evacute a large quantity of water in dropfics. The word is formed of usap zuater, and aniov to drazo or lead; but the application of the term proceeds upon a miltaken fuppofition, that every purgative had fome particular humour which it would evacuate, and which could not be evacuated by any other. It is now, however, difcovered, that all Itrong purgatives will prove byldraggues, if given in large quantity, or in weak conttitutions. The principal medicines recommended as hydragogues, are the juice of elder, the root of iris, foldanella, mcchoacan, jalap, \&c.

HYDRANGEA, in botany: A genus of the digynia order, belonging to the decandria clafs of plants; and in the natural method ranking under the 13 th order, Succulenta. The capfule is bilocular, biroltrated,
ydratis and cut round, or parting horizontally. There is but one fpecies, viz. the arborefcens, a native of North America, from whence it hath lately been brought to Europe, and is preferved in gardens, more for the fake of variety than beauty. It rifes about three feet high; and hath many foft pithy ftalks, garnifned with two oblong heart-haped leaves placed oppofite. The flowers are produced at the top of the thalks in a corymbus. They are white, compofed of five petals with ten ftamina furrounding the flyle. It is eafily propagated by parting the roots; the beft time for which is the end of Octcber. The plants thrive belt in a moift foil, and require to be meltered from fevere frofts.

HYDRASTIS, in botany: A genus no the polygamia order, belonging to the polyandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. 'There is neither calyx nor nectarium; there are three petals; and the berry is compofed of monofpermous aciai.

HYDRARGYRUM, a name given to mercury, or quicktilver. The word is formed of usip aqua, "water," and aszugoc, argentum, "filver;" q. d. acater of filver, on account of its refembling liquid or metted filver.

HYDRAULICS, the feience of the motion of fluids, and the confruction of all kinds of inftruments and machines relating thereto. See Hydrostatics, fect. iv.

HYDRENTEROCELE, in furgery, a fpecies of bernia, wherein the inteltines defeend into the ferotum, together with a quastity of water.

HYDROCELE, in furgery, denotes any hernia arifing from water; but is particularly uted for fuch a one of the ferotum, which fometimes grows to the fize of one's head, without pain, but exceedingly troublefome to the patient. See Surgery.

HIDROCEPHALUS, a preternatural difterfion of the head to an uncommon fize by a flagnation and extravafation of the lymph; which, when colle eted in the infide of the cranium, is then termed internal; as that colleeted on the outlide is termed external. See (the Inde: fuojoined to) Medicive.
hydrocharis, the little water-lily: A genus of the anneandria order, belonging to the dieccia clafs of plants; and in the natural method ranking under the fint order, Palma. The fipatia of the male is diphyllous; the calyx trifid; the corolla tripetalous; the three interior filaments lyyliferous. The female caly $\mathbf{x}$ trifid: the corolla tripetalous; the ftyles fix; the cap. fule has fix cells, and is polyfpermous inferior. There is only one fpecies, a native of Britain, growing in flow freams and wet ditches. It hath kidney fhaped leaves, thick, fmooth, and of a brownifh green culour, with white bloffoms. There is a variety with double flowers of a very fweet fmell.

Hydrocotyle, water-narelwort: A genus of the digynia order, belongiog to the pentandria clafs of plants; and in the natural method ranking under the 45 th order, Umbellata. The umbel is fimple; the involucrum tetraphyllous; the petals entire; the feeds are balf round and compreficd. "There are fevesal feecies, none of which are ever cultivated in gardens. Ope of them, a native of Britain, growing in marihy grounds, is fuppofed by the farmere to occation
the rot in theep. The leaves have central leaf-talks, Hystograwith about five flowers in a rundle; the petals are of a reddih white.

HYDROGRAPHY, the art of meafuring and deHydromel. fcribing the fea, rivere, canals, lakes, sc.-With regard to the fea, it gives an account of its tides, coan. ter-tides, foundings, bays, gulphe, crecks, Sc.; as alfo of the recks, fhelves, fands, hallows, promontories, harbours; the difance and bearing of one port from another; with every thing that is remarkable, whether out at fea or on the coalt.
HYDROLE. H , in butany: A genus of the digynia order, belenging to the pentandria clafs of plants: and in the natural method rankiog with thofe of which the order is doubtrul. The calyx is pentaphyllous; the eorolla rotaceous; the filaments at the bafo are cordate; the capfule is bilocular and bivalved.

HYDROMANCY, a method of divination by water, practifed by the ancients. See Divixation, ${ }^{0}{ }_{7}$.

HYDROMEL, honey diluted in nearly an equal weight of water. When this liquor has nut fermented, it is called fimple bydromel; and when it has undergone the Pirituous fermentation, it is called the ronous bydronel or mead.
Honcy, like all faccharine fubllances, regetable or animal, is fufceptible of fermentation in general, and particularly of the fpirituous fermentation. T'o induce this fermentation, nothing is neceffary but to dilute it fufliciently in water, and to leave this liquor expofed to a convenient degree of heat. T'o make good vinous hydromel or mead, the whitef, purelt, and bell-talled honey molt be chofea; and this mult be put into a kettle with more than its weight of water: a part of this liquor mult be evaporated by hoiling, and the liquor fommed, till its confintence is fuch that a fref egeg thall be fupported upon its furface without finking more than half its thicknefs into the liquor; then the liquor is to be Arained and pouscd through a funncl into a barrel: this barrel, which ought to be nearly full, muft be expofed to a herat as equable as is pofinile, from 20 tn 27 or 28 degrees of Mr Reaumur's thermometer, takiug care that the bung hole be flighly covered, but not clofed. The phenomena of the fpirituous fcrmentation will appear in this liquor, and will fubbit during two or three months, according to the degree of heat; after which they will diminith and coafe. During thes fermenta. tion, the barrel munt be filled up necationally with. more of the fame kind of liquor of boncy, bome of which ought to be kept apart on purpofe to replace the liquor which flows out of the barrel in froth When the fermentation ccafes, and the liquer has hecome very vinous, the bartel is then to be put in a cellar and well clofed. A year afterwards the ment will be fit to be pu: into battles.

The vinous hydromel or mead is an agreeahle kind of wine: neverthelefs it retains long a cante of honey, which is unplealing to Come perfons; but this talle it is faid to lofe entirely by being kept a very long time.

The firituous fermentation of honcy, as alio that of fugar, and of the roolt of vinous lifuors, when it is sery faccharine, is generally more difficultly offected. requires more heat, and continues lunger than that ct ordinaty wines made from the juice of grapes; and thede winous liquots always freferse a faccbarine tafle.
f:shat which thows that a part only of then is become fpiri. ter. tuous.

IIYDROMETER, an infrument to meafure the gravity, denfty, velocity, foree, sir of water and other

'Though this inll rument is incapable of Jetermining the fpecilic gravity of liquors with perfeet accuracy, yet in the way of puhlic butiners it las undoubtedly the advantage of every other, on account of the cafe and expedition with which it can be wed; and for this reafon it has been adopted by government, in order to determine the flrength of fpirituous liquors. Fih. Tran. Dr Blagdon, who was lately employed to make eapevol.8. riments on this fubject, is of opiaion, that glaf is the P-3i2. moll proper material for the contuction of an hy dronveter. Its fenfibility depends on the fize of its Atem. In the old areometers the ftem was made fo large, that the volume of water difplaced between its leaft and greatelt immerfons was equal to the whole difference of ipecific gravity between water and alcohol, or perlaps more; whence its fcale of divifions numf he very fmall, and could not give the feecific gravity with muchaccuracy. On this account weights were introduced, by means of which the fem could be made fmaller; each weight affording a new commencement of its feale; fo that the fize of the divifions on a given length was doubled, tripled, \&c. as one or more weights were employed, the diameter of the fem being laffened in the fubduplicate proportion of the increafed length of the divifons. This method, however, in our author's opinion, has been carried to excefs; and the following is recommended as a proper mean betwixt thefe extremes, to determine the fpecitic gravity of Spiriticous liquors to three places of dacimals.

In thin method the weight of water is fuppofed to be unity, or 1 with any number of cyphers annexed: "the whole compaf3 of numbers, therefure, from rectified fpint to water, at 60 degrees of heat, would be the difference between 825 , the weight of rectified ipirit, and 1000 the weirht of water, which is 175. 'Fo make allowance for the lightet fpirit and heavieft water, however, at all the common temperatures, the difference may be fuppofed $2 \geq 0$. The tem might fhow every twenty of thefe divifions, and thus ten weights would be fufficient for the whole. Hence the inconvenience of hifting the weights, which has always been complained of, woult! in a great meafure be avoided: as people verfant in that bufinefs would feldom err fo far as to the whole amount of the difference previots to making any trial. Hence alfo the Rem may be made fmall enough, and the feale graduated fo nicely as to make the inftrument fufficiently accurate.

According to this arrangement, it would be proper to have the weights adapted to the hydrometer marked with the difletent fpecifie gravities which they are intended to indicate; Zero on the top of the ftem without a weight being fuppofed in mean 800 , and 20 at the bottom to liguify 820 , which number the finf weight would carry; the fucceflive weights being marked, $8,40,860, \mathrm{Zce}$; and the divifion on the llem cut by the fluid under trial, would be a number always to be added to that on the weight; the fum of the two fowing the tue feceific gravity. The weights hould nodoubtedly be aade to apply on the sop of the
flem, fo as never to come in contact with the liquars and in ufing the hydrometer, its ftem fhonld always be prefled down lower than the point at which it will ultimacely reft, that by being wetted it may occalion no refiltance to the fluid. The inftrument itfelf thould be of as regular a hape and with as few inequalities as poffible, that all impediments to its motions may be avuided.

HYDROMPHAL'TS, in medicine and furgery, a tumor in the navel, arifing from a collection of water.

HYDROPHANES OcususMUNDi, or Lapis ML tabilis, a kind of precious fone highly eltermed among the ancients, but little known to the moderns till Mr Boyle made his obfervations epon it. Its fpecific guavity is about 2.048 ; its colour of an opaque whitish brown; it is not foluble in acids nor affected ly alkalies, but is eaffly cut and polifhed. Sometimes it gives fire with fee!, fometimes not. It is infufible per fe; but when urged by a blow-pipe, chan res to a brownifh brittle fuhfiance. It is found in beds over the opals in Hungary, Silefia, and Saxony, and over the chalcedonies and agates in Iceland. - Thefe Atones in general are either of a yellowin green, milky grey, or of a yellow like that of amber.

The moll remarkable property of this fone is, that it becomes tranfparent by mere infufion in any aqueous fluid ; but gradually refumes its opacity when diy. There are three of thefe ftones in the Britifh mufeum at London; the largeft of them about the lize of a cherry ltone, but of an oval form. It is opaque and coloured like a common yellow pea; it may be feratched, though not without difficulty, by a cominon knife, rotwithlanding which it feems to leave a mark upon glafs. It does not ferment with nitrous acid. When it lıas lain fome heurs in water, it becomes tranfparent, and of a yellow amber colour. The change begins foon after the immerion, and at one end in form of a little fpot; hut in a finall one of the fame kind, the tranfparency begins round the edges. By degrees the fpot increafes, until the whole fone becomes uniformly clear throughout: when out of the water it lofes its tranfparency, tirft at one end, and then gradually over the remainder, until the whole has become opaque; which change happens in lefs time than it takes to become tranfparent. 'Ihis change is not entirely peculiar to the hydrophanes. Dergman informs us, that fome Ateatites produce the fame effect; and M. Magellan, that the crult of chalcedonies and agates fiequently produce the fame appearance.

Meffrs Buckman and Veltheim were the firft who particularly inquired into the nature of this itone, and inveftigated its properties, many of which were brought to light by their endeavours. Their account is to the following purpofe. As foon as the fone is put into water, it exhales a mufly finell, feveral air-bubbles arife, and it becomes gradually tranfparent. Some of the tones becone colourlefs as foon as they are thoroughly trat finarent, others have a more or lefs depp yellow colour; fome accutire a beautiful ruby colour; and, latlly, others gain a tine colour of mother-ot-pearl, or of a bluifn opal. Whatever be the colour of the liquor in which the hydrophancs is immerfed, it gans only its ufual deguec of tranfparency with the colur peculiar to it. When we look at it in its racifl fate.

Hydrate
phales,
Hydro Hydroo
plianes.
H Y. D [ 799 ] H Y D
we perceive a luminous point, varying its fituation as the pofition of the cye is altered. This luminous'point is not, according to Mr Bruckman, the immediate image of the fun, but a reflection of tha: image refracted in the fubitance of the fone itfolf, a phenomenon which probably gave rife io the name of oculus mundi. Mr Bruckmant left a piece of this Aone weighing 35 grains fiven hours in water, the fpace requifite to make it perfeetly tranfpartot ; and in that time the found that it had gained three grains in weight. The hydrophanes becomes much fooner tranfarent when put into hot water; and the fame happens if it be dipped in a very dilute acid, or rather a very dilute folution of alkali. When dipped in oil of vitriol, it becomes very quickly tranfparent, and will continue fo, on account of the frong attraction of that acid for moniture, which takes as much from the atmofphere as is neccffary to keep the tone tranfparent ; but its opacity will return if it be dipped in an alkaline liquor and afterwardo dried.

HYDROPHOBIA, an averfon ordread of water: a terrible fympiom of the rabies conina; and which has likewife been found to take in violent inflammations of the ftomach and in hyteric fits. See Medicine. Index.

HYDROPHYLACIA, a word ufed by Kircher and fome others who have written in the fame fytem, to expefs thofe great referwoirs of water which he places in the Alps and other monutains for the fupply of rivers which run through the feveral lower'countries. This he makes to be one of the great ufes of mountains in the tconomy of the univerfe.

HYDROPHYLLAX, in botany: A gedus of the
monogyria order, belonging to the tetrancia clafs of Hjdro. plants. The calys is tetrapartite; the corolla funnel. phyllum Shaped; the fruit two edged and one feeded.

HYDROPHYLLUM, water-leaf: A genus of the monngynia order, belonging to the pentandria clafs of plants; and in the natural method ranking with thofe of which the order is doubtful. The corolla is campanulated, with fire melliferous longitudinat tria on the infide: the Atigma is bitid ; the capfula globofe and bivalved. There is only one fpecies, viz. the V'irginianum, or waterleaf of Morinus. . It grows naturally in Canada and many other parts of America on moit fpongy ground. The root is compofed of many frong firthy fibres, from which arife many leaves with foot-ftalks five or fix inclies long, jagged into three, five, or feven lobes, almof to the midrib, indented on their edges. The flowers are produced in loofe clufters hanging downward, are bellmaped, and of a dirty white colour. It may be propagated by parting the roots; which ought to be done in autumn, that the plants may be well routed before fpring, otherwife they will require a great deal of water.

HYDROPS, in medicine, the fame with Dropss.
HYDROSCOPE, an inftrument ancicntly ufed fur the meafuring of time.

The hydrofeope was a kind of water-clock, confifting of a cylindrical tube, conical at bottom: the cylinder was graduated, or marked out with divifons, to which the top of the water becoming fucceffively contiguous, as it trickled out at the vertex of the cone, pointed out the hour. See lisdrostaticf. fect. vi.
